Changes to 55. Index 1416 164

2* The present implementation has a long ancestry, beginning in the summer of 1977, when Michael F. Plass and Frank M. Liang designed and coded a prototype based on some specifications that the author had made in May of that year. This original protoTEX included macro definitions and elementary manipulations on boxes and glue, but it did not have line-breaking, page-breaking, mathematical formulas, alignment routines, error recovery, or the present semantic nest; furthermore, it used character lists instead of token lists, so that a control sequence like `\halign` was represented by a list of seven characters. A complete version of TEX was designed and coded by the author in late 1977 and early 1978; that program, like its prototype, was written in the SAIL language, for which an excellent debugging system was available. Preliminary plans to convert the SAIL code into a form somewhat like the present "web" were developed by Luis Trabb Pardo and the author at the beginning of 1979, and a complete implementation was created by Ignacio A. Zabala in 1979 and 1980. The TEX82 program, which was written by the author during the latter part of 1981 and the early part of 1982, also incorporates ideas from the 1979 implementation of TEX in MESA that was written by Leonidas Guibas, Robert Sedgewick, and Douglas Wyatt at the Xerox Palo Alto Research Center. Several hundred refinements were introduced into TEX82 based on the experiences gained with the original implementations, so that essentially every part of the system has been substantially improved. After the appearance of "Version 0" in September 1982, this program benefited greatly from the comments of many other people, notably David R. Fuchs and Howard W. Trickey. A final revision in September 1989 extended the input character set to eight-bit codes and introduced the ability to hyphenate words from different languages, based on some ideas of Michael J. Ferguson.

No doubt there still is plenty of room for improvement, but the author is firmly committed to keeping TEX82 "frozen" from now on; stability and reliability are to be its main virtues.

On the other hand, the `WEB` description can be extended without changing the core of TEX82 itself, and the program has been designed so that such extensions are not extremely difficult to make. The *banner* string defined here should be changed whenever TEX undergoes any modifications, so that it will be clear which version of TEX might be the guilty party when a problem arises.

If this program is changed, the resulting system should not be called 'TEX'; the official name 'TEX' by itself is reserved for software systems that are fully compatible with each other. A special test suite called the "`TRIP` test" is available for helping to determine whether a particular implementation deserves to be known as 'TEX' [cf. Stanford Computer Science report CS1027, November 1984].

MLTEX will add new primitives changing the behaviour of TEX. The *banner* string has to be changed. We do not change the *banner* string, but will output an additional line to make clear that this is a modified TEX version.

define *TeX_banner_k* ≡ `´This␣is␣TeXk,␣Version␣3.141592653´` { printed when TEX starts }
define *TeX_banner* ≡ `´This␣is␣TeX,␣Version␣3.141592653´` { printed when TEX starts }

define *banner* ≡ *TeX_banner*
define *banner_k* ≡ *TeX_banner_k*

4.* The program begins with a normal Pascal program heading, whose components will be filled in later, using the conventions of WEB. For example, the portion of the program called '⟨ Global variables 13 ⟩' below will be replaced by a sequence of variable declarations that starts in §13 of this documentation. In this way, we are able to define each individual global variable when we are prepared to understand what it means; we do not have to define all of the globals at once. Cross references in §13, where it says "See also sections 20, 26, ...," also make it possible to look at the set of all global variables, if desired. Similar remarks apply to the other portions of the program heading.

```
define mtype ≡ t@&y@&p@&e  { this is a WEB coding trick: }
format mtype ≡ type  { 'mtype' will be equivalent to 'type' }
format type ≡ true  { but 'type' will not be treated as a reserved word }
⟨ Compiler directives 9 ⟩
program TEX;  { all file names are defined dynamically }
  const ⟨ Constants in the outer block 11* ⟩
  mtype ⟨ Types in the outer block 18 ⟩
  var ⟨ Global variables 13 ⟩
  procedure initialize;  { this procedure gets things started properly }
    var ⟨ Local variables for initialization 19* ⟩
    begin ⟨ Initialize whatever TEX might access 8* ⟩
    end;
  ⟨ Basic printing procedures 57 ⟩
  ⟨ Error handling procedures 78 ⟩
```

6.* For Web2c, labels are not declared in the main program, but we still have to declare the symbolic names.

```
define start_of_TEX = 1  { go here when TEX's variables are initialized }
define final_end = 9999  { this label marks the ending of the program }
```

7.* Some of the code below is intended to be used only when diagnosing the strange behavior that sometimes occurs when TEX is being installed or when system wizards are fooling around with TEX without quite knowing what they are doing. Such code will not normally be compiled; it is delimited by the codewords '**debug** ... **gubed**', with apologies to people who wish to preserve the purity of English.

Similarly, there is some conditional code delimited by '**stat** ... **tats**' that is intended for use when statistics are to be kept about TEX's memory usage. The **stat** ... **tats** code also implements diagnostic information for `\tracingparagraphs`, `\tracingpages`, and `\tracingrestores`.

```
define debug ≡ ifdef('TEXMF_DEBUG')
define gubed ≡ endif('TEXMF_DEBUG')
format debug ≡ begin
format gubed ≡ end
define stat ≡ ifdef('STAT')
define tats ≡ endif('STAT')
format stat ≡ begin
format tats ≡ end
```

8*. This program has two important variations: (1) There is a long and slow version called `INITEX`, which does the extra calculations needed to initialize TEX's internal tables; and (2) there is a shorter and faster production version, which cuts the initialization to a bare minimum. Parts of the program that are needed in (1) but not in (2) are delimited by the codewords '**init** ... **tini**' for declarations and by the codewords '**Init** ... **Tini**' for executable code. This distinction is helpful for implementations where a run-time switch differentiates between the two versions of the program.

```
define init ≡ ifdef('INITEX')
define tini ≡ endif('INITEX')
define Init ≡
        init
        if ini_version then
          begin
define Tini ≡
        end ; tini
format Init ≡ begin
format Tini ≡ end
format init ≡ begin
format tini ≡ end
```

⟨ Initialize whatever TEX might access 8* ⟩ ≡
  ⟨ Set initial values of key variables 21 ⟩
  Init ⟨ Initialize table entries (done by `INITEX` only) 164 ⟩ **Tini**

This code is used in section 4*.

11:* The following parameters can be changed at compile time to extend or reduce TEX's capacity. They may have different values in `INITEX` and in production versions of TEX.

define *file_name_size* ≡ *maxint*
define *ssup_error_line* = 255
define *ssup_max_strings* ≡ 2097151
{ Larger values than 65536 cause the arrays to consume much more memory. }
define *ssup_trie_opcode* ≡ 65535
define *ssup_trie_size* ≡ "3FFFFF
define *ssup_hyph_size* ≡ 65535 { Changing this requires changing (un)dumping! }
define *iinf_hyphen_size* ≡ 610 { Must be not less than *hyph_prime*! }
define *max_font_max* = 9000 { maximum number of internal fonts; this can be increased, but *hash_size* + *max_font_max* should not exceed 29000. }
define *font_base* = 0 { smallest internal font number; must be ≥ *min_quarterword*; do not change this without modifying the dynamic definition of the font arrays. }

⟨ Constants in the outer block 11* ⟩ ≡
hash_offset = 514; { smallest index in hash array, i.e., *hash_base* }
{ Use *hash_offset* = 0 for compilers which cannot decrement pointers. }
trie_op_size = 35111;
{ space for "opcodes" in the hyphenation patterns; best if relatively prime to 313, 361, and 1009. }
neg_trie_op_size = −35111; { for lower *trie_op_hash* array bound; must be equal to −*trie_op_size*. }
min_trie_op = 0; { first possible trie op code for any language }
max_trie_op = *ssup_trie_opcode*; { largest possible trie opcode for any language }
pool_name = *TEXMF_POOL_NAME*; { this is configurable, for the sake of ML-TEX }
{ string of length *file_name_size*; tells where the string pool appears }
engine_name = *TEXMF_ENGINE_NAME*; { the name of this engine }
inf_mem_bot = 0; *sup_mem_bot* = 1; *inf_main_memory* = 3000; *sup_main_memory* = 256000000;
inf_trie_size = 8000; *sup_trie_size* = *ssup_trie_size*; *inf_max_strings* = 3000;
sup_max_strings = *ssup_max_strings*; *inf_strings_free* = 100; *sup_strings_free* = *sup_max_strings*;
inf_buf_size = 500; *sup_buf_size* = 30000000; *inf_nest_size* = 40; *sup_nest_size* = 4000;
inf_max_in_open = 6; *sup_max_in_open* = 127; *inf_param_size* = 60; *sup_param_size* = 32767;
inf_save_size = 600; *sup_save_size* = 30000000; *inf_stack_size* = 200; *sup_stack_size* = 30000;
inf_dvi_buf_size = 800; *sup_dvi_buf_size* = 65536; *inf_font_mem_size* = 20000;
sup_font_mem_size = 147483647; { *integer*-limited, so 2 could be prepended? }
sup_font_max = *max_font_max*; *inf_font_max* = 50; { could be smaller, but why? }
inf_pool_size = 32000; *sup_pool_size* = 40000000; *inf_pool_free* = 1000; *sup_pool_free* = *sup_pool_size*;
inf_string_vacancies = 8000; *sup_string_vacancies* = *sup_pool_size* − 23000;
sup_hash_extra = *sup_max_strings*; *inf_hash_extra* = 0; *sup_hyph_size* = *ssup_hyph_size*;
inf_hyph_size = *iinf_hyphen_size*; { Must be not less than *hyph_prime*! }
inf_expand_depth = 10; *sup_expand_depth* = 10000000;

This code is used in section 4*.

12.* Like the preceding parameters, the following quantities can be changed at compile time to extend or reduce TEX's capacity. But if they are changed, it is necessary to rerun the initialization program `INITEX` to generate new tables for the production TEX program. One can't simply make helter-skelter changes to the following constants, since certain rather complex initialization numbers are computed from them. They are defined here using `WEB` macros, instead of being put into Pascal's **const** list, in order to emphasize this distinction.

```
define hash_size = 15000 { maximum number of control sequences; it should be at most about
        (mem_max − mem_min)/10; see also font_max }
define hash_prime = 8501 { a prime number equal to about 85% of hash_size }
define hyph_prime = 607 { another prime for hashing \hyphenation exceptions; if you change this,
        you should also change iinf_hyphen_size. }
```

16.* Here are some macros for common programming idioms.

```
define negate(#) ≡ # ← −# { change the sign of a variable }
define loop ≡ while true do { repeat over and over until a goto happens }
format loop ≡ xclause { WEB's xclause acts like 'while true do' }
define do_nothing ≡ { empty statement }
define return ≡ goto exit { terminate a procedure call }
format return ≡ nil
define empty = 0 { symbolic name for a null constant }
```

19:* The original Pascal compiler was designed in the late 60s, when six-bit character sets were common, so it did not make provision for lowercase letters. Nowadays, of course, we need to deal with both capital and small letters in a convenient way, especially in a program for typesetting; so the present specification of TEX has been written under the assumption that the Pascal compiler and run-time system permit the use of text files with more than 64 distinguishable characters. More precisely, we assume that the character set contains at least the letters and symbols associated with ASCII codes *´40* through *´176*; all of these characters are now available on most computer terminals.

Since we are dealing with more characters than were present in the first Pascal compilers, we have to decide what to call the associated data type. Some Pascals use the original name *char* for the characters in text files, even though there now are more than 64 such characters, while other Pascals consider *char* to be a 64-element subrange of a larger data type that has some other name.

In order to accommodate this difference, we shall use the name *text_char* to stand for the data type of the characters that are converted to and from *ASCII_code* when they are input and output. We shall also assume that *text_char* consists of the elements *chr*(*first_text_char*) through *chr*(*last_text_char*), inclusive. The following definitions should be adjusted if necessary.

define *text_char* ≡ *ASCII_code* { the data type of characters in text files }
define *first_text_char* = 0 { ordinal number of the smallest element of *text_char* }
define *last_text_char* = 255 { ordinal number of the largest element of *text_char* }

⟨ Local variables for initialization 19* ⟩ ≡
i: *integer*;

See also sections 163 and 927.

This code is used in section 4*.

20:* The TEX processor converts between ASCII code and the user's external character set by means of arrays *xord* and *xchr* that are analogous to Pascal's *ord* and *chr* functions.

```
⟨ Global variables 13 ⟩ +≡
xord: array [text_char] of ASCII_code;  { specifies conversion of input characters }
xchr: array [ASCII_code] of text_char;  { specifies conversion of output characters }
xprn: array [ASCII_code] of ASCII_code;  { non zero iff character is printable }
mubyte_read: array [ASCII_code] of pointer;  { non zero iff character begins the multi byte code }
mubyte_write: array [ASCII_code] of str_number;
        { non zero iff character expands to multi bytes in log and write files }
mubyte_cswrite: array [0 .. 127] of pointer;
        { non null iff cs mod 128 expands to multi bytes in log and write files }
mubyte_skip: integer;  { the number of bytes to skip in buffer }
mubyte_keep: integer;  { the number of chars we need to keep unchanged }
mubyte_skeep: integer;  { saved mubyte_keep }
mubyte_prefix: integer;  { the type of mubyte prefix }
mubyte_tablein: boolean;  { the input side of table will be updated }
mubyte_tableout: boolean;  { the output side of table will be updated }
mubyte_relax: boolean;  { the relax prefix is used }
mubyte_start: boolean;  { we are making the token at the start of the line }
mubyte_sstart: boolean;  { saved mubyte_start }
mubyte_token: pointer;  { the token returned by read_buffer }
mubyte_stoken: pointer;  { saved first token in mubyte primitive }
mubyte_sout: integer;  { saved value of mubyte_out }
mubyte_slog: integer;  { saved value of mubyte_log }
spec_sout: integer;  { saved value of spec_out }
no_convert: boolean;  { conversion supressed by noconvert primitive }
active_noconvert: boolean;  { true if noconvert primitive is active }
write_noexpanding: boolean;  { true only if we need not write expansion }
cs_converting: boolean;  { true only if we need csname converting }
special_printing: boolean;  { true only if we need converting in special }
message_printing: boolean;  { true if message or errmessage prints to string }
```

23:* The ASCII code is "standard" only to a certain extent, since many computer installations have found it advantageous to have ready access to more than 94 printing characters. Appendix C of *The TEXbook* gives a complete specification of the intended correspondence between characters and TEX's internal representation.

If TEX is being used on a garden-variety Pascal for which only standard ASCII codes will appear in the input and output files, it doesn't really matter what codes are specified in *xchr*[0 .. *'37*], but the safest policy is to blank everything out by using the code shown below.

However, other settings of *xchr* will make TEX more friendly on computers that have an extended character set, so that users can type things like '≠' instead of '`\ne`'. People with extended character sets can assign codes arbitrarily, giving an *xchr* equivalent to whatever characters the users of TEX are allowed to have in their input files. It is best to make the codes correspond to the intended interpretations as shown in Appendix C whenever possible; but this is not necessary. For example, in countries with an alphabet of more than 26 letters, it is usually best to map the additional letters into codes less than *'40*. To get the most "permissive" character set, change *'␣'* on the right of these assignment statements to *chr*(*i*).

⟨ Set initial values of key variables 21 ⟩ +≡
{ Initialize *xchr* to the identity mapping. }
for *i* ← 0 **to** *'37* **do** *xchr*[*i*] ← *i*;
for *i* ← *'177* **to** *'377* **do** *xchr*[*i*] ← *i*; { Initialize encTEX data. }
for *i* ← 0 **to** 255 **do** *mubyte_read*[*i*] ← *null*;
for *i* ← 0 **to** 255 **do** *mubyte_write*[*i*] ← 0;
for *i* ← 0 **to** 127 **do** *mubyte_cswrite*[*i*] ← *null*;
mubyte_keep ← 0; *mubyte_start* ← *false*; *write_noexpanding* ← *false*; *cs_converting* ← *false*;
special_printing ← *false*; *message_printing* ← *false*; *no_convert* ← *false*; *active_noconvert* ← *false*;

24:* The following system-independent code makes the *xord* array contain a suitable inverse to the information in *xchr*. Note that if *xchr*[*i*] = *xchr*[*j*] where *i* < *j* < *'177*, the value of *xord*[*xchr*[*i*]] will turn out to be *j* or more; hence, standard ASCII code numbers will be used instead of codes below *'40* in case there is a coincidence.

⟨ Set initial values of key variables 21 ⟩ +≡
for *i* ← *first_text_char* **to** *last_text_char* **do** *xord*[*chr*(*i*)] ← *invalid_code*;
for *i* ← *'200* **to** *'377* **do** *xord*[*xchr*[*i*]] ← *i*;
for *i* ← 0 **to** *'176* **do** *xord*[*xchr*[*i*]] ← *i*; { Set *xprn* for printable ASCII, unless *eight_bit_p* is set. }
for *i* ← 0 **to** 255 **do** *xprn*[*i*] ← (*eight_bit_p* ∨ ((*i* ≥ "␣") ∧ (*i* ≤ "~"))); { The idea for this dynamic translation comes from the patch by Libor Skarvada `<libor@informatics.muni.cz>` and Petr Sojka `<sojka@informatics.muni.cz>`. I didn't use any of the actual code, though, preferring a more general approach. }
{ This updates the *xchr*, *xord*, and *xprn* arrays from the provided *translate_filename*. See the function definition in `texmfmp.c` for more comments. }
if *translate_filename* **then** *read_tcx_file*;

26.* Most of what we need to do with respect to input and output can be handled by the I/O facilities that are standard in Pascal, i.e., the routines called *get*, *put*, *eof*, and so on. But standard Pascal does not allow file variables to be associated with file names that are determined at run time, so it cannot be used to implement TEX; some sort of extension to Pascal's ordinary *reset* and *rewrite* is crucial for our purposes. We shall assume that *name_of_file* is a variable of an appropriate type such that the Pascal run-time system being used to implement TEX can open a file whose external name is specified by *name_of_file*.

⟨ Global variables 13 ⟩ +≡
name_of_file: ↑*text_char*;
name_length: 0 .. *file_name_size*;
{ this many characters are actually relevant in *name_of_file* (the rest are blank) }

27.* All of the file opening functions are defined in C.

28.* And all the file closing routines as well.

30.* Input from text files is read one line at a time, using a routine called *input_ln*. This function is defined in terms of global variables called *buffer*, *first*, and *last* that will be described in detail later; for now, it suffices for us to know that *buffer* is an array of *ASCII_code* values, and that *first* and *last* are indices into this array representing the beginning and ending of a line of text.

⟨ Global variables 13 ⟩ +≡
buffer: ↑*ASCII_code*; { lines of characters being read }
first: 0 .. *buf_size*; { the first unused position in *buffer* }
last: 0 .. *buf_size*; { end of the line just input to *buffer* }
max_buf_stack: 0 .. *buf_size*; { largest index used in *buffer* }

31.* The *input_ln* function brings the next line of input from the specified file into available positions of the buffer array and returns the value *true*, unless the file has already been entirely read, in which case it returns *false* and sets *last* ← *first*. In general, the *ASCII_code* numbers that represent the next line of the file are input into *buffer*[*first*], *buffer*[*first* + 1], ..., *buffer*[*last* − 1]; and the global variable *last* is set equal to *first* plus the length of the line. Trailing blanks are removed from the line; thus, either *last* = *first* (in which case the line was entirely blank) or *buffer*[*last* − 1] ≠ "␣".

An overflow error is given, however, if the normal actions of *input_ln* would make *last* ≥ *buf_size*; this is done so that other parts of TEX can safely look at the contents of *buffer*[*last* + 1] without overstepping the bounds of the *buffer* array. Upon entry to *input_ln*, the condition *first* < *buf_size* will always hold, so that there is always room for an "empty" line.

The variable *max_buf_stack*, which is used to keep track of how large the *buf_size* parameter must be to accommodate the present job, is also kept up to date by *input_ln*.

If the *bypass_eoln* parameter is *true*, *input_ln* will do a *get* before looking at the first character of the line; this skips over an *eoln* that was in *f*↑. The procedure does not do a *get* when it reaches the end of the line; therefore it can be used to acquire input from the user's terminal as well as from ordinary text files.

Standard Pascal says that a file should have *eoln* immediately before *eof*, but TEX needs only a weaker restriction: If *eof* occurs in the middle of a line, the system function *eoln* should return a *true* result (even though *f*↑ will be undefined).

Since the inner loop of *input_ln* is part of TEX's "inner loop"—each character of input comes in at this place—it is wise to reduce system overhead by making use of special routines that read in an entire array of characters at once, if such routines are available. The following code uses standard Pascal to illustrate what needs to be done, but finer tuning is often possible at well-developed Pascal sites.

We define *input_ln* in C, for efficiency. Nevertheless we quote the module 'Report overflow of the input buffer, and abort' here in order to make `WEAVE` happy, since part of that module is needed by e-TeX.

`@{`⟨ Report overflow of the input buffer, and abort 35* ⟩`@}`

32* The user's terminal acts essentially like other files of text, except that it is used both for input and for output. When the terminal is considered an input file, the file variable is called *term_in*, and when it is considered an output file the file variable is *term_out*.

define *term_in* ≡ *stdin* { the terminal as an input file }
define *term_out* ≡ *stdout* { the terminal as an output file }

⟨ Global variables 13 ⟩ +≡
init *ini_version*: *boolean*; { are we INITEX? }
dump_option: *boolean*; { was the dump name option used? }
dump_line: *boolean*; { was a %&format line seen? }
tini

dump_name: *const_cstring*; { format name for terminal display }

bound_default: *integer*; { temporary for setup }
bound_name: *const_cstring*; { temporary for setup }

mem_bot: *integer*;
{ smallest index in the *mem* array dumped by INITEX; must not be less than *mem_min* }
main_memory: *integer*; { total memory words allocated in initex }
extra_mem_bot: *integer*; { *mem_min* ← *mem_bot* − *extra_mem_bot* except in INITEX }
mem_min: *integer*; { smallest index in TEX's internal *mem* array; must be *min_halfword* or more; must be equal to *mem_bot* in INITEX, otherwise ≤ *mem_bot* }
mem_top: *integer*; { largest index in the *mem* array dumped by INITEX; must be substantially larger than *mem_bot*, equal to *mem_max* in INITEX, else not greater than *mem_max* }
extra_mem_top: *integer*; { *mem_max* ← *mem_top* + *extra_mem_top* except in INITEX }
mem_max: *integer*; { greatest index in TEX's internal *mem* array; must be strictly less than *max_halfword*; must be equal to *mem_top* in INITEX, otherwise ≥ *mem_top* }
error_line: *integer*; { width of context lines on terminal error messages }
half_error_line: *integer*; { width of first lines of contexts in terminal error messages; should be between 30 and *error_line* − 15 }
max_print_line: *integer*; { width of longest text lines output; should be at least 60 }
max_strings: *integer*; { maximum number of strings; must not exceed *max_halfword* }
strings_free: *integer*; { strings available after format loaded }
string_vacancies: *integer*; { the minimum number of characters that should be available for the user's control sequences and font names, after TEX's own error messages are stored }
pool_size: *integer*; { maximum number of characters in strings, including all error messages and help texts, and the names of all fonts and control sequences; must exceed *string_vacancies* by the total length of TEX's own strings, which is currently about 23000 }
pool_free: *integer*; { pool space free after format loaded }
font_mem_size: *integer*; { number of words of *font_info* for all fonts }
font_max: *integer*; { maximum internal font number; ok to exceed *max_quarterword* and must be at most *font_base*+*max_font_max* }
font_k: *integer*; { loop variable for initialization }
hyph_size: *integer*; { maximum number of hyphen exceptions }
trie_size: *integer*; { space for hyphenation patterns; should be larger for INITEX than it is in production versions of TEX. 50000 is needed for English, German, and Portuguese. }
buf_size: *integer*; { maximum number of characters simultaneously present in current lines of open files and in control sequences between \csname and \endcsname; must not exceed *max_halfword* }
stack_size: *integer*; { maximum number of simultaneous input sources }
max_in_open: *integer*;
{ maximum number of input files and error insertions that can be going on simultaneously }
param_size: *integer*; { maximum number of simultaneous macro parameters }
nest_size: *integer*; { maximum number of semantic levels simultaneously active }
save_size: *integer*; { space for saving values outside of current group; must be at most *max_halfword* }

dvi_buf_size: *integer*; { size of the output buffer; must be a multiple of 8 }
expand_depth: *integer*; { limits recursive calls to the *expand* procedure }
parse_first_line_p: *cinttype*; { parse the first line for options }
file_line_error_style_p: *cinttype*; { format messages as file:line:error }
eight_bit_p: *cinttype*; { make all characters printable by default }
halt_on_error_p: *cinttype*; { stop at first error }

33.* Here is how to open the terminal files. *t_open_out* does nothing. *t_open_in*, on the other hand, does the work of "rescanning," or getting any command line arguments the user has provided. It's defined in C.

define *t_open_out* ≡ { output already open for text output }

34.* Sometimes it is necessary to synchronize the input/output mixture that happens on the user's terminal, and three system-dependent procedures are used for this purpose. The first of these, *update_terminal*, is called when we want to make sure that everything we have output to the terminal so far has actually left the computer's internal buffers and been sent. The second, *clear_terminal*, is called when we wish to cancel any input that the user may have typed ahead (since we are about to issue an unexpected error message). The third, *wake_up_terminal*, is supposed to revive the terminal if the user has disabled it by some instruction to the operating system. The following macros show how these operations can be specified with UNIX. *update_terminal* does an *fflush*. *clear_terminal* is redefined to do nothing, since the user should control the terminal.

define *update_terminal* ≡ *fflush*(*term_out*)
define *clear_terminal* ≡ *do_nothing*
define *wake_up_terminal* ≡ *do_nothing* { cancel the user's cancellation of output }

35* We need a special routine to read the first line of TEX input from the user's terminal. This line is different because it is read before we have opened the transcript file; there is sort of a "chicken and egg" problem here. If the user types '`\input paper`' on the first line, or if some macro invoked by that line does such an `\input`, the transcript file will be named '`paper.log`'; but if no `\input` commands are performed during the first line of terminal input, the transcript file will acquire its default name '`texput.log`'. (The transcript file will not contain error messages generated by the first line before the first `\input` command.)

The first line is even more special if we are lucky enough to have an operating system that treats TEX differently from a run-of-the-mill Pascal object program. It's nice to let the user start running a TEX job by typing a command line like '`tex paper`'; in such a case, TEX will operate as if the first line of input were '`paper`', i.e., the first line will consist of the remainder of the command line, after the part that invoked TEX.

The first line is special also because it may be read before TEX has input a format file. In such cases, normal error messages cannot yet be given. The following code uses concepts that will be explained later. (If the Pascal compiler does not support non-local **goto**, the statement '**goto** *final_end*' should be replaced by something that quietly terminates the program.)

Routine is implemented in C; part of module is, however, needed for e-TeX.

```
⟨ Report overflow of the input buffer, and abort 35* ⟩ ≡
  begin cur_input.loc_field ← first; cur_input.limit_field ← last − 1; overflow("buffer␣size", buf_size);
  end
```

This code is used in section 31*.

37* The following program does the required initialization. Iff anything has been specified on the command line, then *t_open_in* will return with *last* > *first*.

```
function init_terminal: boolean; { gets the terminal input started }
  label exit;
  begin t_open_in;
  if last > first then
    begin loc ← first;
    while (loc < last) ∧ (buffer[loc] = ´␣´) do incr(loc);
    if loc < last then
      begin init_terminal ← true; goto exit;
      end;
    end;
  loop begin wake_up_terminal; write(term_out, ´**´); update_terminal;
    if ¬input_ln(term_in, true) then { this shouldn't happen }
      begin write_ln(term_out); write_ln(term_out, ´!␣End␣of␣file␣on␣the␣terminal...␣why?´);
      init_terminal ← false; return;
      end;
    loc ← first;
    while (loc < last) ∧ (buffer[loc] = "␣") do incr(loc);
    if loc < last then
      begin init_terminal ← true; return; { return unless the line was all blank }
      end;
    write_ln(term_out, ´Please␣type␣the␣name␣of␣your␣input␣file.´);
    end;
exit: end;
```

38.* String handling. Control sequence names and diagnostic messages are variable-length strings of eight-bit characters. Since Pascal does not have a well-developed string mechanism, TEX does all of its string processing by homegrown methods.

Elaborate facilities for dynamic strings are not needed, so all of the necessary operations can be handled with a simple data structure. The array *str_pool* contains all of the (eight-bit) ASCII codes in all of the strings, and the array *str_start* contains indices of the starting points of each string. Strings are referred to by integer numbers, so that string number s comprises the characters $str\_pool[j]$ for $str\_start[s] \le j < str\_start[s+1]$. Additional integer variables *pool_ptr* and *str_ptr* indicate the number of entries used so far in *str_pool* and *str_start*, respectively; locations $str\_pool[pool\_ptr]$ and $str\_start[str\_ptr]$ are ready for the next string to be allocated.

String numbers 0 to 255 are reserved for strings that correspond to single ASCII characters. This is in accordance with the conventions of WEB, which converts single-character strings into the ASCII code number of the single character involved, while it converts other strings into integers and builds a string pool file. Thus, when the string constant `"."` appears in the program below, WEB converts it into the integer 46, which is the ASCII code for a period, while WEB will convert a string like `"hello"` into some integer greater than 255. String number 46 will presumably be the single character '.'; but some ASCII codes have no standard visible representation, and TEX sometimes needs to be able to print an arbitrary ASCII character, so the first 256 strings are used to specify exactly what should be printed for each of the 256 possibilities.

Elements of the *str_pool* array must be ASCII codes that can actually be printed; i.e., they must have an *xchr* equivalent in the local character set. (This restriction applies only to preloaded strings, not to those generated dynamically by the user.)

Some Pascal compilers won't pack integers into a single byte unless the integers lie in the range $-128 \ldots 127$. To accommodate such systems we access the string pool only via macros that can easily be redefined.

```
define si(#) ≡ #   { convert from ASCII_code to packed_ASCII_code }
define so(#) ≡ #   { convert from packed_ASCII_code to ASCII_code }
```

```
⟨ Types in the outer block 18 ⟩ +≡
  pool_pointer = integer;   { for variables that point into str_pool }
  str_number = 0 .. ssup_max_strings;   { for variables that point into str_start }
  packed_ASCII_code = 0 .. 255;   { elements of str_pool array }
```

39.* ⟨ Global variables 13 ⟩ +≡

```
str_pool: ↑packed_ASCII_code;   { the characters }
str_start: ↑pool_pointer;   { the starting pointers }
pool_ptr: pool_pointer;   { first unused position in str_pool }
str_ptr: str_number;   { number of the current string being created }
init_pool_ptr: pool_pointer;   { the starting value of pool_ptr }
init_str_ptr: str_number;   { the starting value of str_ptr }
```

47.* The initial values of *str_pool*, *str_start*, *pool_ptr*, and *str_ptr* are computed by the INITEX program, based in part on the information that WEB has output while processing TEX.

```
⟨ Declare additional routines for string recycling 1388* ⟩
  init function get_strings_started: boolean;
      { initializes the string pool, but returns false if something goes wrong }
  label done, exit;
  var k, l: 0 .. 255;   { small indices or counters }
    g: str_number;   { garbage }
  begin pool_ptr ← 0; str_ptr ← 0; str_start[0] ← 0; ⟨ Make the first 256 strings 48 ⟩;
  ⟨ Read the other strings from the TEX.POOL file and return true, or give an error message and return
      false 51* ⟩;
exit: end;
  tini
```

49:* The first 128 strings will contain 95 standard ASCII characters, and the other 33 characters will be printed in three-symbol form like '`^^A`' unless a system-dependent change is made here. Installations that have an extended character set, where for example *xchr*[*'32*] = *'≠'*, would like string *'32* to be printed as the single character *'32* instead of the three characters *'136*, *'136*, *'132* (`^^Z`). On the other hand, even people with an extended character set will want to represent string *'15* by `^^M`, since *'15* is *carriage_return*; the idea is to produce visible strings instead of tabs or line-feeds or carriage-returns or bell-rings or characters that are treated anomalously in text files.

Unprintable characters of codes 128–255 are, similarly, rendered `^^80`–`^^ff`.

The boolean expression defined here should be *true* unless TEX internal code number *k* corresponds to a non-troublesome visible symbol in the local character set. An appropriate formula for the extended character set recommended in *The TEXbook* would, for example, be '$k \in [0, \text{'10} \,..\, \text{'12}, \text{'14}, \text{'15}, \text{'33}, \text{'177} \,..\, \text{'377}]$'. If character *k* cannot be printed, and $k < \text{'200}$, then character $k + \text{'100}$ or $k - \text{'100}$ must be printable; moreover, ASCII codes [*'41* .. *'46*, *'60* .. *'71*, *'136*, *'141* .. *'146*, *'160* .. *'171*] must be printable. Thus, at least 80 printable characters are needed.

⟨ Character *k* cannot be printed 49* ⟩ ≡
```
(k < " ") ∨ (k > "~")
```
This code is used in section 48.

51:* ⟨ Read the other strings from the `TEX.POOL` file and return *true*, or give an error message and return *false* 51* ⟩ ≡
```
g ← loadpoolstrings((pool_size − string_vacancies));
if g = 0 then
  begin wake_up_terminal; write_ln(term_out, '!␣You␣have␣to␣increase␣POOLSIZE.');
  get_strings_started ← false; return;
  end;
get_strings_started ← true;
```
This code is used in section 47*.

52:* Empty module

53:* Empty module

54.* On-line and off-line printing. Messages that are sent to a user's terminal and to the transcript-log file are produced by several '*print*' procedures. These procedures will direct their output to a variety of places, based on the setting of the global variable *selector*, which has the following possible values:

term_and_log, the normal setting, prints on the terminal and on the transcript file.
log_only, prints only on the transcript file.
term_only, prints only on the terminal.
no_print, doesn't print at all. This is used only in rare cases before the transcript file is open.
pseudo, puts output into a cyclic buffer that is used by the *show_context* routine; when we get to that routine we shall discuss the reasoning behind this curious mode.
new_string, appends the output to the current string in the string pool.
0 to 15, prints on one of the sixteen files for `\write` output.

The symbolic names '*term_and_log*', etc., have been assigned numeric codes that satisfy the convenient relations $no\_print + 1 = term\_only$, $no\_print + 2 = log\_only$, $term\_only + 2 = log\_only + 1 = term\_and\_log$.

Three additional global variables, *tally* and *term_offset* and *file_offset*, record the number of characters that have been printed since they were most recently cleared to zero. We use *tally* to record the length of (possibly very long) stretches of printing; *term_offset* and *file_offset*, on the other hand, keep track of how many characters have appeared so far on the current line that has been output to the terminal or to the transcript file, respectively.

```
define no_print = 16  { selector setting that makes data disappear }
define term_only = 17  { printing is destined for the terminal only }
define log_only = 18  { printing is destined for the transcript file only }
define term_and_log = 19  { normal selector setting }
define pseudo = 20  { special selector setting for show_context }
define new_string = 21  { printing is deflected to the string pool }
define max_selector = 21  { highest selector setting }
```

```
⟨ Global variables 13 ⟩ +≡
log_file: alpha_file;  { transcript of TEX session }
selector: 0 .. max_selector;  { where to print a message }
dig: array [0 .. 22] of 0 .. 15;  { digits in a number being output }
tally: integer;  { the number of characters recently printed }
term_offset: 0 .. max_print_line;  { the number of characters on the current terminal line }
file_offset: 0 .. max_print_line;  { the number of characters on the current file line }
trick_buf: array [0 .. ssup_error_line] of ASCII_code;  { circular buffer for pseudoprinting }
trick_count: integer;  { threshold for pseudoprinting, explained later }
first_count: integer;  { another variable for pseudoprinting }
```

59:* An entire string is output by calling *print*. Note that if we are outputting the single standard ASCII character `c`, we could call *print*("c"), since "c" = 99 is the number of a single-character string, as explained above. But *print_char*("c") is quicker, so TEX goes directly to the *print_char* routine when it knows that this is safe. (The present implementation assumes that it is always safe to print a visible ASCII character.)

```
⟨ Basic printing procedures 57 ⟩ +≡
procedure print(s : integer); { prints string s }
  label exit;
  var j: pool_pointer; { current character code position }
    nl: integer; { new-line character to restore }
  begin if s ≥ str_ptr then s ← "???" { this can't happen }
  else if s < 256 then
      if s < 0 then s ← "???" { can't happen }
      else begin if (selector > pseudo) ∧ (¬special_printing) ∧ (¬message_printing) then
          begin print_char(s); return; { internal strings are not expanded }
          end;
        if (⟨ Character s is the current new-line character 244 ⟩) then
          if selector < pseudo then
            begin print_ln; no_convert ← false; return;
            end
          else if message_printing then
              begin print_char(s); no_convert ← false; return;
              end;
        if (mubyte_log > 0) ∧ (¬no_convert) ∧ (mubyte_write[s] > 0) then s ← mubyte_write[s]
        else if xprn[s] ∨ special_printing then
            begin print_char(s); no_convert ← false; return;
            end;
        no_convert ← false; nl ← new_line_char; new_line_char ← −1;
            { temporarily disable new-line character }
        j ← str_start[s];
        while j < str_start[s + 1] do
          begin print_char(so(str_pool[j])); incr(j);
          end;
        new_line_char ← nl; return;
        end;
  j ← str_start[s];
  while j < str_start[s + 1] do
    begin print_char(so(str_pool[j])); incr(j);
    end;
exit: end;
```

61:* Here is the very first thing that TEX prints: a headline that identifies the version number and format package. The *term_offset* variable is temporarily incorrect, but the discrepancy is not serious since we assume that this part of the program is system dependent.

```
⟨ Initialize the output routines 55 ⟩ +≡
  if src_specials_p ∨ file_line_error_style_p ∨ parse_first_line_p then wterm(banner_k)
  else wterm(banner);
  wterm(version_string);
  if format_ident = 0 then wterm_ln('␣(preloaded␣format=', dump_name, ')')
  else begin slow_print(format_ident); print_ln;
    end;
  if shellenabledp then
    begin wterm('␣');
    if restrictedshell then
      begin wterm('restricted␣');
      end;
    wterm_ln('\write18␣enabled.');
    end;
  if src_specials_p then
    begin wterm_ln('␣Source␣specials␣enabled.')
    end;
  if translate_filename then
    begin wterm('␣('); fputs(translate_filename, stdout); wterm_ln(')');
    end;
  update_terminal;
```

71:* Here is a procedure that asks the user to type a line of input, assuming that the *selector* setting is either *term_only* or *term_and_log*. The input is placed into locations *first* through *last* − 1 of the *buffer* array, and echoed on the transcript file if appropriate.

This procedure is never called when *interaction* < *scroll_mode*.

```
  define prompt_input(#) ≡
          begin wake_up_terminal; print(#); term_input;
          end { prints a string and gets a line of input }
procedure term_input; { gets a line from the terminal }
  var k: 0 .. buf_size; { index into buffer }
  begin update_terminal; { now the user sees the prompt for sure }
  if ¬input_ln(term_in, true) then
    begin limit ← 0; fatal_error("End␣of␣file␣on␣the␣terminal!");
    end;
  term_offset ← 0; { the user's line ended with ⟨return⟩ }
  decr(selector); { prepare to echo the input }
  k ← first;
  while k < last do
    begin print_buffer(k)
    end;
  print_ln; incr(selector); { restore previous status }
  end;
```

73:* The global variable *interaction* has four settings, representing increasing amounts of user interaction:

```
define batch_mode = 0  { omits all stops and omits terminal output }
define nonstop_mode = 1  { omits all stops }
define scroll_mode = 2  { omits error stops }
define error_stop_mode = 3  { stops at every opportunity to interact }
define unspecified_mode = 4  { extra value for command-line switch }
define print_err(#) ≡
        begin if interaction = error_stop_mode then wake_up_terminal;
        if file_line_error_style_p then print_file_line
        else print_nl("! ");
        print(#);
        end
```

⟨ Global variables 13 ⟩ +≡

```
interaction: batch_mode .. error_stop_mode;  { current level of interaction }
interaction_option: batch_mode .. unspecified_mode;  { set from command line }
```

74:* ⟨ Set initial values of key variables 21 ⟩ +≡

```
if interaction_option = unspecified_mode then interaction ← error_stop_mode
else interaction ← interaction_option;
```

81:* The *jump_out* procedure just cuts across all active procedure levels. The body of *jump_out* simply calls '*close_files_and_terminate*;' followed by a call on some system procedure that quietly terminates the program.

```
format noreturn ≡ procedure
define do_final_end ≡
        begin update_terminal; ready_already ← 0;
        if (history ≠ spotless) ∧ (history ≠ warning_issued) then uexit(1)
        else uexit(0);
        end
```

⟨ Error handling procedures 78 ⟩ +≡

```
noreturn procedure jump_out;
    begin close_files_and_terminate; do_final_end;
    end;
```

82:* Here now is the general *error* routine.

```
⟨ Error handling procedures 78 ⟩ +≡
procedure error; { completes the job of error reporting }
  label continue, exit;
  var c: ASCII_code; { what the user types }
    s1, s2, s3, s4: integer; { used to save global variables when deleting tokens }
  begin if history < error_message_issued then history ← error_message_issued;
  print_char("."); show_context;
  if (halt_on_error_p) then
    begin history ← fatal_error_stop; jump_out;
    end;
  if interaction = error_stop_mode then ⟨ Get user's advice and return 83 ⟩;
  incr(error_count);
  if error_count = 100 then
    begin print_nl("(That␣makes␣100␣errors;␣please␣try␣again.)"); history ← fatal_error_stop;
    jump_out;
    end;
  ⟨ Put help message on the transcript file 90 ⟩;
exit: end;
```

84:* It is desirable to provide an '`E`' option here that gives the user an easy way to return from TEX to the system editor, with the offending line ready to be edited. We do this by calling the external procedure *call_edit* with a pointer to the filename, its length, and the line number. However, here we just set up the variables that will be used as arguments, since we don't want to do the switch-to-editor until after TeX has closed its files.

There is a secret '`D`' option available when the debugging routines haven't been commented out.

```
  define edit_file ≡ input_stack[base_ptr]
⟨ Interpret code c and return if done 84* ⟩ ≡
  case c of
  "0","1","2","3","4","5","6","7","8","9": if deletions_allowed then
      ⟨ Delete c − "0" tokens and goto continue 88 ⟩;
 debug "D": begin debug_help; goto continue; end; gubed
  "E": if base_ptr > 0 then
      if input_stack[base_ptr].name_field ≥ 256 then
        begin edit_name_start ← str_start[edit_file.name_field];
        edit_name_length ← str_start[edit_file.name_field + 1] − str_start[edit_file.name_field];
        edit_line ← line; jump_out;
        end;
  "H": ⟨ Print the help information and goto continue 89 ⟩;
  "I": ⟨ Introduce new material from the terminal and return 87 ⟩;
  "Q","R","S": ⟨ Change the interaction level and return 86 ⟩;
  "X": begin interaction ← scroll_mode; jump_out;
    end;
  othercases do_nothing
  endcases;
  ⟨ Print the menu of available options 85 ⟩
```

This code is used in section 83.

93:* The following procedure prints TEX's last words before dying.

```
define succumb ≡
    begin if interaction = error_stop_mode then interaction ← scroll_mode;
        { no more interaction }
    if log_opened then error;
    debug if interaction > batch_mode then debug_help;
    gubed
    history ← fatal_error_stop; jump_out; { irrecoverable error }
    end
```

```
⟨ Error handling procedures 78 ⟩ +≡
noreturn procedure fatal_error(s : str_number); { prints s, and that's it }
  begin normalize_selector;
  print_err("Emergency␣stop"); help1(s); succumb;
  end;
```

94:* Here is the most dreaded error message.

```
⟨ Error handling procedures 78 ⟩ +≡
noreturn procedure overflow(s : str_number; n : integer); { stop due to finiteness }
  begin normalize_selector; print_err("TeX␣capacity␣exceeded,␣sorry␣["); print(s);
  print_char("="); print_int(n); print_char("]");
  help2("If␣you␣really␣absolutely␣need␣more␣capacity,")
  ("you␣can␣ask␣a␣wizard␣to␣enlarge␣me."); succumb;
  end;
```

95:* The program might sometime run completely amok, at which point there is no choice but to stop. If no previous error has been detected, that's bad news; a message is printed that is really intended for the TEX maintenance person instead of the user (unless the user has been particularly diabolical). The index entries for 'this can't happen' may help to pinpoint the problem.

```
⟨ Error handling procedures 78 ⟩ +≡
noreturn procedure confusion(s : str_number); { consistency check violated; s tells where }
  begin normalize_selector;
  if history < error_message_issued then
    begin print_err("This␣can't␣happen␣("); print(s); print_char(")");
    help1("I'm␣broken.␣Please␣show␣this␣to␣someone␣who␣can␣fix␣can␣fix");
    end
  else begin print_err("I␣can't␣go␣on␣meeting␣you␣like␣this");
    help2("One␣of␣your␣faux␣pas␣seems␣to␣have␣wounded␣me␣deeply...")
    ("in␣fact,␣I'm␣barely␣conscious.␣Please␣fix␣it␣and␣try␣again.");
    end;
  succumb;
  end;
```

104:* Physical sizes that a TEX user specifies for portions of documents are represented internally as scaled points. Thus, if we define an 'sp' (scaled point) as a unit equal to 2^{-16} printer's points, every dimension inside of TEX is an integer number of sp. There are exactly 4,736,286.72 sp per inch. Users are not allowed to specify dimensions larger than $2^{30} - 1$ sp, which is a distance of about 18.892 feet (5.7583 meters); two such quantities can be added without overflow on a 32-bit computer.

The present implementation of TEX does not check for overflow when dimensions are added or subtracted. This could be done by inserting a few dozen tests of the form '**if** $x \geq$ *'10000000000* **then** *report_overflow*', but the chance of overflow is so remote that such tests do not seem worthwhile.

TEX needs to do only a few arithmetic operations on scaled quantities, other than addition and subtraction, and the following subroutines do most of the work. A single computation might use several subroutine calls, and it is desirable to avoid producing multiple error messages in case of arithmetic overflow; so the routines set the global variable *arith_error* to *true* instead of reporting errors directly to the user. Another global variable, *remainder*, holds the remainder after a division.

define *remainder* ≡ *tex_remainder*

⟨ Global variables 13 ⟩ +≡
arith_error: *boolean*; { has arithmetic overflow occurred recently? }
remainder: *scaled*; { amount subtracted to get an exact division }

109:* When TEX "packages" a list into a box, it needs to calculate the proportionality ratio by which the glue inside the box should stretch or shrink. This calculation does not affect TEX's decision making, so the precise details of rounding, etc., in the glue calculation are not of critical importance for the consistency of results on different computers.

We shall use the type *glue_ratio* for such proportionality ratios. A glue ratio should take the same amount of memory as an *integer* (usually 32 bits) if it is to blend smoothly with TEX's other data structures. Thus *glue_ratio* should be equivalent to *short_real* in some implementations of Pascal. Alternatively, it is possible to deal with glue ratios using nothing but fixed-point arithmetic; see *TUGboat* **3**,1 (March 1982), 10–27. (But the routines cited there must be modified to allow negative glue ratios.)

define *set_glue_ratio_zero*(#) ≡ # ← 0.0 { store the representation of zero ratio }
define *set_glue_ratio_one*(#) ≡ # ← 1.0 { store the representation of unit ratio }
define *float*(#) ≡ # { convert from *glue_ratio* to type *real* }
define *unfloat*(#) ≡ # { convert from *real* to type *glue_ratio* }
define *float_constant*(#) ≡ #.0 { convert *integer* constant to *real* }

⟨ Types in the outer block 18 ⟩ +≡

110.* Packed data. In order to make efficient use of storage space, TEX bases its major data structures on a *memory_word*, which contains either a (signed) integer, possibly scaled, or a (signed) *glue_ratio*, or a small number of fields that are one half or one quarter of the size used for storing integers.

If x is a variable of type *memory_word*, it contains up to four fields that can be referred to as follows:

$x.int$	(an *integer*)
$x.sc$	(a *scaled* integer)
$x.gr$	(a *glue_ratio*)
$x.hh.lh$, $x.hh.rh$	(two halfword fields)
$x.hh.b0$, $x.hh.b1$, $x.hh.rh$	(two quarterword fields, one halfword field)
$x.qqqq.b0$, $x.qqqq.b1$, $x.qqqq.b2$, $x.qqqq.b3$	(four quarterword fields)

This is somewhat cumbersome to write, and not very readable either, but macros will be used to make the notation shorter and more transparent. The Pascal code below gives a formal definition of *memory_word* and its subsidiary types, using packed variant records. TEX makes no assumptions about the relative positions of the fields within a word.

Since we are assuming 32-bit integers, a halfword must contain at least 16 bits, and a quarterword must contain at least 8 bits. But it doesn't hurt to have more bits; for example, with enough 36-bit words you might be able to have *mem_max* as large as 262142, which is eight times as much memory as anybody had during the first four years of TEX's existence.

N.B.: Valuable memory space will be dreadfully wasted unless TEX is compiled by a Pascal that packs all of the *memory_word* variants into the space of a single integer. This means, for example, that *glue_ratio* words should be *short_real* instead of *real* on some computers. Some Pascal compilers will pack an integer whose subrange is '0 .. 255' into an eight-bit field, but others insist on allocating space for an additional sign bit; on such systems you can get 256 values into a quarterword only if the subrange is '−128 .. 127'.

The present implementation tries to accommodate as many variations as possible, so it makes few assumptions. If integers having the subrange '*min_quarterword* .. *max_quarterword*' can be packed into a quarterword, and if integers having the subrange '*min_halfword* .. *max_halfword*' can be packed into a halfword, everything should work satisfactorily.

It is usually most efficient to have *min_quarterword* = *min_halfword* = 0, so one should try to achieve this unless it causes a severe problem. The values defined here are recommended for most 32-bit computers.

```
define min_quarterword = 0  { smallest allowable value in a quarterword }
define max_quarterword = 255  { largest allowable value in a quarterword }
define min_halfword ≡ -"FFFFFFF  { smallest allowable value in a halfword }
define max_halfword ≡ "FFFFFFF  { largest allowable value in a halfword }
```

111.* Here are the inequalities that the quarterword and halfword values must satisfy (or rather, the inequalities that they mustn't satisfy):

```
⟨ Check the "constant" values for consistency 14 ⟩ +≡
  init if (mem_min ≠ mem_bot) ∨ (mem_max ≠ mem_top) then bad ← 10;
  tini
  if (mem_min > mem_bot) ∨ (mem_max < mem_top) then bad ← 10;
  if (min_quarterword > 0) ∨ (max_quarterword < 127) then bad ← 11;
  if (min_halfword > 0) ∨ (max_halfword < 32767) then bad ← 12;
  if (min_quarterword < min_halfword) ∨ (max_quarterword > max_halfword) then bad ← 13;
  if (mem_bot − sup_main_memory < min_halfword) ∨ (mem_top + sup_main_memory ≥ max_halfword)
      then bad ← 14;
  if (max_font_max < min_halfword) ∨ (max_font_max > max_halfword) then bad ← 15;
  if font_max > font_base + max_font_max then bad ← 16;
  if (save_size > max_halfword) ∨ (max_strings > max_halfword) then bad ← 17;
  if buf_size > max_halfword then bad ← 18;
  if max_quarterword − min_quarterword < 255 then bad ← 19;
```

112:* The operation of adding or subtracting *min_quarterword* occurs quite frequently in TEX, so it is convenient to abbreviate this operation by using the macros *qi* and *qo* for input and output to and from quarterword format.

The inner loop of TEX will run faster with respect to compilers that don't optimize expressions like '$x+0$' and '$x-0$', if these macros are simplified in the obvious way when *min_quarterword* $= 0$. So they have been simplified here in the obvious way.

The WEB source for TEX defines $hi(\#) \equiv \# + min\_halfword$ which can be simplified when *min_halfword* $= 0$. The Web2C implementation of TEX can use $hi(\#) \equiv \#$ together with *min_halfword* < 0 as long as *max_halfword* is sufficiently large.

define $qi(\#) \equiv \#$ { to put an *eight_bits* item into a quarterword }
define $qo(\#) \equiv \#$ { to take an *eight_bits* item from a quarterword }
define $hi(\#) \equiv \#$ { to put a sixteen-bit item into a halfword }
define $ho(\#) \equiv \#$ { to take a sixteen-bit item from a halfword }

113:* The reader should study the following definitions closely:

define $sc \equiv int$ { *scaled* data is equivalent to *integer* }

⟨ Types in the outer block 18 ⟩ +≡
quarterword = *min_quarterword* .. *max_quarterword*; *halfword* = *min_halfword* .. *max_halfword*;
two_choices = 1 .. 2; { used when there are two variants in a record }
four_choices = 1 .. 4; { used when there are four variants in a record }
`#include␣"texmfmem.h";` *word_file* = **file of** *memory_word*;

116:* The *mem* array is divided into two regions that are allocated separately, but the dividing line between these two regions is not fixed; they grow together until finding their "natural" size in a particular job. Locations less than or equal to *lo_mem_max* are used for storing variable-length records consisting of two or more words each. This region is maintained using an algorithm similar to the one described in exercise 2.5–19 of *The Art of Computer Programming*. However, no size field appears in the allocated nodes; the program is responsible for knowing the relevant size when a node is freed. Locations greater than or equal to *hi_mem_min* are used for storing one-word records; a conventional `AVAIL` stack is used for allocation in this region.

Locations of *mem* between *mem_bot* and *mem_top* may be dumped as part of preloaded format files, by the `INITEX` preprocessor. Production versions of TEX may extend the memory at both ends in order to provide more space; locations between *mem_min* and *mem_bot* are always used for variable-size nodes, and locations between *mem_top* and *mem_max* are always used for single-word nodes.

The key pointers that govern *mem* allocation have a prescribed order:

$$null \le mem\_min \le mem\_bot < lo\_mem\_max < hi\_mem\_min < mem\_top \le mem\_end \le mem\_max .$$

Empirical tests show that the present implementation of TEX tends to spend about 9% of its running time allocating nodes, and about 6% deallocating them after their use.

⟨ Global variables 13 ⟩ +≡
yzmem: ↑*memory_word*; { the big dynamic storage area }
zmem: ↑*memory_word*; { the big dynamic storage area }
lo_mem_max: *pointer*; { the largest location of variable-size memory in use }
hi_mem_min: *pointer*; { the smallest location of one-word memory in use }

144:* The *new_ligature* function creates a ligature node having given contents of the *font*, *character*, and *lig_ptr* fields. We also have a *new_lig_item* function, which returns a two-word node having a given *character* field. Such nodes are used for temporary processing as ligatures are being created.

```
function new_ligature(f : internal_font_number; c : quarterword; q : pointer): pointer;
  var p: pointer;  { the new node }
  begin p ← get_node(small_node_size); type(p) ← ligature_node; font(lig_char(p)) ← f;
  character(lig_char(p)) ← c; lig_ptr(p) ← q; subtype(p) ← 0; new_ligature ← p;
  end;
function new_lig_item(c : quarterword): pointer;
  var p: pointer;  { the new node }
  begin p ← get_node(small_node_size); character(p) ← c; lig_ptr(p) ← null; new_lig_item ← p;
  end;
```

165:* If TEX is extended improperly, the *mem* array might get screwed up. For example, some pointers might be wrong, or some "dead" nodes might not have been freed when the last reference to them disappeared. Procedures *check_mem* and *search_mem* are available to help diagnose such problems. These procedures make use of two arrays called *free* and *was_free* that are present only if TEX's debugging routines have been included. (You may want to decrease the size of *mem* while you are debugging.)

```
define free ≡ free_arr
⟨ Global variables 13 ⟩ +≡
  { The debug memory arrays have not been mallocated yet. }
debug free: packed array [0 .. 9] of boolean; { free cells }
was_free: packed array [0 .. 9] of boolean; { previously free cells }
was_mem_end, was_lo_max, was_hi_min: pointer; { previous mem_end, lo_mem_max, and hi_mem_min }
panicking: boolean; { do we want to check memory constantly? }
gubed
```

174:* Boxes, rules, inserts, whatsits, marks, and things in general that are sort of "complicated" are indicated only by printing '`[]`'.

```
procedure short_display(p : integer);  { prints highlights of list p }
  var n: integer;  { for replacement counts }
  begin while p > mem_min do
    begin if is_char_node(p) then
      begin if p ≤ mem_end then
        begin if font(p) ≠ font_in_short_display then
          begin if (font(p) > font_max) then print_char("*")
          else ⟨ Print the font identifier for font(p) 267 ⟩;
          print_char("␣"); font_in_short_display ← font(p);
          end;
        print_ASCII(qo(character(p)));
        end;
      end
    else ⟨ Print a short indication of the contents of node p 175 ⟩;
    p ← link(p);
    end;
  end;
```

176:* The *show_node_list* routine requires some auxiliary subroutines: one to print a font-and-character combination, one to print a token list without its reference count, and one to print a rule dimension.

```
procedure print_font_and_char(p : integer);  { prints char_node data }
  begin if p > mem_end then print_esc("CLOBBERED.")
  else begin if (font(p) > font_max) then print_char("*")
    else ⟨ Print the font identifier for font(p) 267 ⟩;
    print_char("␣"); print_ASCII(qo(character(p)));
    end;
  end;
procedure print_mark(p : integer);  { prints token list data in braces }
  begin print_char("{");
  if (p < hi_mem_min) ∨ (p > mem_end) then print_esc("CLOBBERED.")
  else show_token_list(link(p), null, max_print_line − 10);
  print_char("}");
  end;
procedure print_rule_dimen(d : scaled);  { prints dimension in rule node }
  begin if is_running(d) then print_char("*")
  else print_scaled(d);
  end;
```

186.* The code will have to change in this place if *glue_ratio* is a structured type instead of an ordinary *real*. Note that this routine should avoid arithmetic errors even if the *glue_set* field holds an arbitrary random value. The following code assumes that a properly formed nonzero *real* number has absolute value 2^{20} or more when it is regarded as an integer; this precaution was adequate to prevent floating point underflow on the author's computer.

```
⟨ Display the value of glue_set(p) 186* ⟩ ≡
  g ← float(glue_set(p));
  if (g ≠ float_constant(0)) ∧ (glue_sign(p) ≠ normal) then
    begin print(",␣glue␣set␣");
    if glue_sign(p) = shrinking then print("-␣");  { The Unix pc folks removed this restriction with a
        remark that invalid bit patterns were vanishingly improbable, so we follow their example without
        really understanding it. if abs(mem[p + glue_offset].int) < '4000000 then print('?.?') else }
    if fabs(g) > float_constant(20000) then
      begin if g > float_constant(0) then print_char(">")
      else print("<␣-");
      print_glue(20000 * unity, glue_order(p), 0);
      end
    else print_glue(round(unity * g), glue_order(p), 0);
    end
```

This code is used in section 184.

209:* The next codes are special; they all relate to mode-independent assignment of values to TEX's internal registers or tables. Codes that are *max_internal* or less represent internal quantities that might be expanded by '`\the`'.

define *toks_register* = 71 { token list register (`\toks`) }
define *assign_toks* = 72 { special token list (`\output`, `\everypar`, etc.) }
define *assign_int* = 73 { user-defined integer (`\tolerance`, `\day`, etc.) }
define *assign_dimen* = 74 { user-defined length (`\hsize`, etc.) }
define *assign_glue* = 75 { user-defined glue (`\baselineskip`, etc.) }
define *assign_mu_glue* = 76 { user-defined muglue (`\thinmuskip`, etc.) }
define *assign_font_dimen* = 77 { user-defined font dimension (`\fontdimen`) }
define *assign_font_int* = 78 { user-defined font integer (`\hyphenchar`, `\skewchar`) }
define *set_aux* = 79 { specify state info (`\spacefactor`, `\prevdepth`) }
define *set_prev_graf* = 80 { specify state info (`\prevgraf`) }
define *set_page_dimen* = 81 { specify state info (`\pagegoal`, etc.) }
define *set_page_int* = 82 { specify state info (`\deadcycles`, `\insertpenalties`) }
define *set_box_dimen* = 83 { change dimension of box (`\wd`, `\ht`, `\dp`) }
define *set_shape* = 84 { specify fancy paragraph shape (`\parshape`) }
define *def_code* = 85 { define a character code (`\catcode`, etc.) }
define *def_family* = 86 { declare math fonts (`\textfont`, etc.) }
define *set_font* = 87 { set current font (font identifiers) }
define *def_font* = 88 { define a font file (`\font`) }
define *register* = 89 { internal register (`\count`, `\dimen`, etc.) }
define *max_internal* = 89 { the largest code that can follow `\the` }
define *advance* = 90 { advance a register or parameter (`\advance`) }
define *multiply* = 91 { multiply a register or parameter (`\multiply`) }
define *divide* = 92 { divide a register or parameter (`\divide`) }
define *prefix* = 93 { qualify a definition (`\global`, `\long`, `\outer`) }
define *let* = 94 { assign a command code (`\let`, `\futurelet`) }
define *shorthand_def* = 95 { code definition (`\chardef`, `\countdef`, etc.) }
{ or `\charsubdef` }
define *read_to_cs* = 96 { read into a control sequence (`\read`) }
define *def* = 97 { macro definition (`\def`, `\gdef`, `\xdef`, `\edef`) }
define *set_box* = 98 { set a box (`\setbox`) }
define *hyph_data* = 99 { hyphenation data (`\hyphenation`, `\patterns`) }
define *set_interaction* = 100 { define level of interaction (`\batchmode`, etc.) }
define *max_command* = 100 { the largest command code seen at *big_switch* }

211.* The semantic nest. TEX is typically in the midst of building many lists at once. For example, when a math formula is being processed, TEX is in math mode and working on an mlist; this formula has temporarily interrupted TEX from being in horizontal mode and building the hlist of a paragraph; and this paragraph has temporarily interrupted TEX from being in vertical mode and building the vlist for the next page of a document. Similarly, when a `\vbox` occurs inside of an `\hbox`, TEX is temporarily interrupted from working in restricted horizontal mode, and it enters internal vertical mode. The "semantic nest" is a stack that keeps track of what lists and modes are currently suspended.

At each level of processing we are in one of six modes:

vmode stands for vertical mode (the page builder);
hmode stands for horizontal mode (the paragraph builder);
mmode stands for displayed formula mode;
$-$*vmode* stands for internal vertical mode (e.g., in a `\vbox`);
$-$*hmode* stands for restricted horizontal mode (e.g., in an `\hbox`);
$-$*mmode* stands for math formula mode (not displayed).

The mode is temporarily set to zero while processing `\write` texts.

Numeric values are assigned to *vmode*, *hmode*, and *mmode* so that TEX's "big semantic switch" can select the appropriate thing to do by computing the value $abs(mode) + cur\_cmd$, where *mode* is the current mode and *cur_cmd* is the current command code.

```
define vmode = 1  { vertical mode }
define hmode = vmode + max_command + 1  { horizontal mode }
define mmode = hmode + max_command + 1  { math mode }
procedure print_mode(m : integer);  { prints the mode represented by m }
  begin if m > 0 then
    case m div (max_command + 1) of
    0: print("vertical␣mode");
    1: print("horizontal␣mode");
    2: print("display␣math␣mode");
    end
  else if m = 0 then print("no␣mode")
    else case (−m) div (max_command + 1) of
      0: print("internal␣vertical␣mode");
      1: print("restricted␣horizontal␣mode");
      2: print("math␣mode");
      end;
  end;
procedure print_in_mode(m : integer);  { prints the mode represented by m }
  begin if m > 0 then
    case m div (max_command + 1) of
    0: print("´␣in␣vertical␣mode");
    1: print("´␣in␣horizontal␣mode");
    2: print("´␣in␣display␣math␣mode");
    end
  else if m = 0 then print("´␣in␣no␣mode")
    else case (−m) div (max_command + 1) of
      0: print("´␣in␣internal␣vertical␣mode");
      1: print("´␣in␣restricted␣horizontal␣mode");
      2: print("´␣in␣math␣mode");
      end;
  end;
```

213.* **define** *mode* ≡ *cur_list.mode_field* { current mode }
define *head* ≡ *cur_list.head_field* { header node of current list }
define *tail* ≡ *cur_list.tail_field* { final node on current list }
define *prev_graf* ≡ *cur_list.pg_field* { number of paragraph lines accumulated }
define *aux* ≡ *cur_list.aux_field* { auxiliary data about the current list }
define *prev_depth* ≡ *aux.sc* { the name of *aux* in vertical mode }
define *space_factor* ≡ *aux.hh.lh* { part of *aux* in horizontal mode }
define *clang* ≡ *aux.hh.rh* { the other part of *aux* in horizontal mode }
define *incompleat_noad* ≡ *aux.int* { the name of *aux* in math mode }
define *mode_line* ≡ *cur_list.ml_field* { source file line number at beginning of list }

⟨ Global variables 13 ⟩ +≡
nest: ↑*list_state_record*;
nest_ptr: 0 .. *nest_size*; { first unused location of *nest* }
max_nest_stack: 0 .. *nest_size*; { maximum of *nest_ptr* when pushing }
cur_list: *list_state_record*; { the "top" semantic state }
shown_mode: −*mmode* .. *mmode*; { most recent mode shown by `\tracingcommands` }

215.* We will see later that the vertical list at the bottom semantic level is split into two parts; the "current page" runs from *page_head* to *page_tail*, and the "contribution list" runs from *contrib_head* to *tail* of semantic level zero. The idea is that contributions are first formed in vertical mode, then "contributed" to the current page (during which time the page-breaking decisions are made). For now, we don't need to know any more details about the page-building process.

⟨ Set initial values of key variables 21 ⟩ +≡

end;
2: **if** *a.int* ≠ *null* **then**
begin *print*("`this␣will␣begin␣denominator␣of:`"); *show_box*(*a.int*); **end**;
end { there are no other cases }

This code is used in section 218.

220.* The table of equivalents. Now that we have studied the data structures for TEX's semantic routines, we ought to consider the data structures used by its syntactic routines. In other words, our next concern will be the tables that TEX looks at when it is scanning what the user has written.

The biggest and most important such table is called *eqtb*. It holds the current "equivalents" of things; i.e., it explains what things mean or what their current values are, for all quantities that are subject to the nesting structure provided by TEX's grouping mechanism. There are six parts to *eqtb*:

1) *eqtb*[*active_base* .. (*hash_base* − 1)] holds the current equivalents of single-character control sequences.

2) *eqtb*[*hash_base* .. (*glue_base* − 1)] holds the current equivalents of multiletter control sequences.

3) *eqtb*[*glue_base* .. (*local_base* − 1)] holds the current equivalents of glue parameters like the current baselineskip.

4) *eqtb*[*local_base* .. (*int_base* − 1)] holds the current equivalents of local halfword quantities like the current box registers, the current "catcodes," the current font, and a pointer to the current paragraph shape. Additionally region 4 contains the table with MLTEX's character substitution definitions.

5) *eqtb*[*int_base* .. (*dimen_base* − 1)] holds the current equivalents of fullword integer parameters like the current hyphenation penalty.

6) *eqtb*[*dimen_base* .. *eqtb_size*] holds the current equivalents of fullword dimension parameters like the current hsize or amount of hanging indentation.

Note that, for example, the current amount of baselineskip glue is determined by the setting of a particular location in region 3 of *eqtb*, while the current meaning of the control sequence '`\baselineskip`' (which might have been changed by `\def` or `\let`) appears in region 2.

222:* Many locations in *eqtb* have symbolic names. The purpose of the next paragraphs is to define these names, and to set up the initial values of the equivalents.

In the first region we have 256 equivalents for "active characters" that act as control sequences, followed by 256 equivalents for single-character control sequences.

Then comes region 2, which corresponds to the hash table that we will define later. The maximum address in this region is used for a dummy control sequence that is perpetually undefined. There also are several locations for control sequences that are perpetually defined (since they are used in error recovery).

```
define active_base = 1 { beginning of region 1, for active character equivalents }
define single_base = active_base + 256 { equivalents of one-character control sequences }
define null_cs = single_base + 256 { equivalent of \csname\endcsname }
define hash_base = null_cs + 1 { beginning of region 2, for the hash table }
define frozen_control_sequence = hash_base + hash_size { for error recovery }
define frozen_protection = frozen_control_sequence { inaccessible but definable }
define frozen_cr = frozen_control_sequence + 1 { permanent '\cr' }
define frozen_end_group = frozen_control_sequence + 2 { permanent '\endgroup' }
define frozen_right = frozen_control_sequence + 3 { permanent '\right' }
define frozen_fi = frozen_control_sequence + 4 { permanent '\fi' }
define frozen_end_template = frozen_control_sequence + 5 { permanent '\endtemplate' }
define frozen_endv = frozen_control_sequence + 6 { second permanent '\endtemplate' }
define frozen_relax = frozen_control_sequence + 7 { permanent '\relax' }
define end_write = frozen_control_sequence + 8 { permanent '\endwrite' }
define frozen_dont_expand = frozen_control_sequence + 9 { permanent '\notexpanded:' }
define frozen_special = frozen_control_sequence + 10 { permanent '\special' }
define frozen_null_font = frozen_control_sequence + 11 { permanent '\nullfont' }
define font_id_base = frozen_null_font − font_base { begins table of 257 permanent font identifiers }
define undefined_control_sequence = frozen_null_font + max_font_max + 1 { dummy location }
define glue_base = undefined_control_sequence + 1 { beginning of region 3 }
```

⟨ Initialize table entries (done by INITEX only) 164 ⟩ +≡

```
eq_type(undefined_control_sequence) ← undefined_cs; equiv(undefined_control_sequence) ← null;
eq_level(undefined_control_sequence) ← level_zero;
for k ← active_base to eqtb_top do eqtb[k] ← eqtb[undefined_control_sequence];
```

230.* Region 4 of *eqtb* contains the local quantities defined here. The bulk of this region is taken up by five tables that are indexed by eight-bit characters; these tables are important to both the syntactic and semantic portions of TEX. There are also a bunch of special things like font and token parameters, as well as the tables of `\toks` and `\box` registers.

define *par_shape_loc* = *local_base* { specifies paragraph shape }
define *output_routine_loc* = *local_base* + 1 { points to token list for `\output` }
define *every_par_loc* = *local_base* + 2 { points to token list for `\everypar` }
define *every_math_loc* = *local_base* + 3 { points to token list for `\everymath` }
define *every_display_loc* = *local_base* + 4 { points to token list for `\everydisplay` }
define *every_hbox_loc* = *local_base* + 5 { points to token list for `\everyhbox` }
define *every_vbox_loc* = *local_base* + 6 { points to token list for `\everyvbox` }
define *every_job_loc* = *local_base* + 7 { points to token list for `\everyjob` }
define *every_cr_loc* = *local_base* + 8 { points to token list for `\everycr` }
define *err_help_loc* = *local_base* + 9 { points to token list for `\errhelp` }
define *toks_base* = *local_base* + 10 { table of 256 token list registers }
define *box_base* = *toks_base* + 256 { table of 256 box registers }
define *cur_font_loc* = *box_base* + 256 { internal font number outside math mode }
define *xord_code_base* = *cur_font_loc* + 1

primitive("`errhelp`", *assign_toks*, *err_help_loc*);

236.* Region 5 of *eqtb* contains the integer parameters and registers defined here, as well as the *del_code* table. The latter table differs from the *cat_code* .. *math_code* tables that precede it, since delimiter codes are fullword integers while the other kinds of codes occupy at most a halfword. This is what makes region 5 different from region 4. We will store the *eq_level* information in an auxiliary array of quarterwords that will be defined later.

240.* The integer parameters should really be initialized by a macro package; the following initialization does the minimum to keep TEX from complete failure.

⟨ Initialize table entries (done by INITEX only) 164 ⟩ +≡
for *k* ← *int_base* **to** *del_code_base* − 1 **do** *eqtb*[*k*].*int* ← 0;
char_sub_def_min ← 256; *char_sub_def_max* ← −1; { allow \charsubdef for char 0 }
{ *tracing_char_sub_def* ← 0 is already done }
mag ← 1000; *tolerance* ← 10000; *hang_after* ← 1; *max_dead_cycles* ← 25; *escape_char* ← "\";
end_line_char ← *carriage_return*;
for *k* ← 0 **to** 255 **do** *del_code*(*k*) ← −1;
del_code(".") ← 0; { this null delimiter is used in error recovery }

241.* The following procedure, which is called just before TEX initializes its input and output, establishes the initial values of the date and time. It calls a *date_and_time* C macro (a.k.a. *dateandtime*), which calls the C function *get_date_and_time*, passing it the addresses of *sys_time*, etc., so they can be set by the routine. *get_date_and_time* also sets up interrupt catching if that is conditionally compiled in the C code.

We have to initialize the *sys_* variables because that is what gets output on the first line of the log file. (New in 2021.)

procedure *fix_date_and_time*;
begin *date_and_time*(*sys_time*, *sys_day*, *sys_month*, *sys_year*); *time* ← *sys_time*;
{ minutes since midnight }
day ← *sys_day*; { day of the month }
month ← *sys_month*; { month of the year }
year ← *sys_year*; { Anno Domini }
end;

252:* Here is a procedure that displays the contents of $eqtb[n]$ symbolically.

```
⟨ Declare the procedure called print_cmd_chr 298 ⟩
  stat procedure show_eqtb(n : pointer);
  begin if n < active_base then print_char("?")   { this can't happen }
  else if (n < glue_base) ∨ ((n > eqtb_size) ∧ (n ≤ eqtb_top)) then ⟨ Show equivalent n, in region 1 or 2 223 ⟩
    else if n < local_base then ⟨ Show equivalent n, in region 3 229 ⟩
      else if n < int_base then ⟨ Show equivalent n, in region 4 233 ⟩
        else if n < dimen_base then ⟨ Show equivalent n, in region 5 242 ⟩
          else if n ≤ eqtb_size then ⟨ Show equivalent n, in region 6 251 ⟩
            else print_char("?");   { this can't happen either }
  end;
  tats
```

253:* The last two regions of *eqtb* have fullword values instead of the three fields *eq_level*, *eq_type*, and *equiv*. An *eq_type* is unnecessary, but TEX needs to store the *eq_level* information in another array called *xeq_level*.

```
⟨ Global variables 13 ⟩ +≡
zeqtb: ↑memory_word;
xeq_level: array [int_base .. eqtb_size] of quarterword;
```

256.* The hash table. Control sequences are stored and retrieved by means of a fairly standard hash table algorithm called the method of "coalescing lists" (cf. Algorithm 6.4C in *The Art of Computer Programming*). Once a control sequence enters the table, it is never removed, because there are complicated situations involving `\gdef` where the removal of a control sequence at the end of a group would be a mistake preventable only by the introduction of a complicated reference-count mechanism.

The actual sequence of letters forming a control sequence identifier is stored in the *str_pool* array together with all the other strings. An auxiliary array *hash* consists of items with two halfword fields per word. The first of these, called *next*(*p*), points to the next identifier belonging to the same coalesced list as the identifier corresponding to *p*; and the other, called *text*(*p*), points to the *str_start* entry for *p*'s identifier. If position *p* of the hash table is empty, we have *text*(*p*) = 0; if position *p* is either empty or the end of a coalesced hash list, we have *next*(*p*) = 0. An auxiliary pointer variable called *hash_used* is maintained in such a way that all locations $p \geq hash\_used$ are nonempty. The global variable *cs_count* tells how many multiletter control sequences have been defined, if statistics are being kept.

A global boolean variable called *no_new_control_sequence* is set to *true* during the time that new hash table entries are forbidden.

```
define next(#) ≡ hash[#].lh   { link for coalesced lists }
define text(#) ≡ hash[#].rh   { string number for control sequence name }
define hash_is_full ≡ (hash_used = hash_base)   { test if all positions are occupied }
define font_id_text(#) ≡ text(font_id_base + #)   { a frozen font identifier's name }
```

```
⟨ Global variables 13 ⟩ +≡
hash: ↑two_halves;   { the hash table }
yhash: ↑two_halves;   { auxiliary pointer for freeing hash }
hash_used: pointer;   { allocation pointer for hash }
hash_extra: pointer;   { hash_extra = hash above eqtb_size }
hash_top: pointer;   { maximum of the hash array }
eqtb_top: pointer;   { maximum of the eqtb }
hash_high: pointer;   { pointer to next high hash location }
no_new_control_sequence: boolean;   { are new identifiers legal? }
cs_count: integer;   { total number of known identifiers }
```

257.* ⟨ Set initial values of key variables 21 ⟩ +≡

```
no_new_control_sequence ← true;   { new identifiers are usually forbidden }
```

258.* ⟨ Initialize table entries (done by `INITEX` only) 164 ⟩ +≡

```
hash_used ← frozen_control_sequence;   { nothing is used }
hash_high ← 0; cs_count ← 0; eq_type(frozen_dont_expand) ← dont_expand;
text(frozen_dont_expand) ← "notexpanded:";
```

260:* ⟨ Insert a new control sequence after p, then make p point to it 260* ⟩ ≡

```
begin if text(p) > 0 then
  begin if hash_high < hash_extra then
    begin incr(hash_high); next(p) ← hash_high + eqtb_size; p ← hash_high + eqtb_size;
    end
  else begin repeat if hash_is_full then overflow("hash␣size", hash_size + hash_extra);
      decr(hash_used);
    until text(hash_used) = 0;  { search for an empty location in hash }
    next(p) ← hash_used; p ← hash_used;
    end;
  end;
str_room(l); d ← cur_length;
while pool_ptr > str_start[str_ptr] do
  begin decr(pool_ptr); str_pool[pool_ptr + l] ← str_pool[pool_ptr];
  end;  { move current string up to make room for another }
for k ← j to j + l − 1 do append_char(buffer[k]);
text(p) ← make_string; pool_ptr ← pool_ptr + d;
stat incr(cs_count); tats
end
```

This code is used in section 259.

262:* Single-character control sequences do not need to be looked up in a hash table, since we can use the character code itself as a direct address. The procedure *print_cs* prints the name of a control sequence, given a pointer to its address in *eqtb*. A space is printed after the name unless it is a single nonletter or an active character. This procedure might be invoked with invalid data, so it is "extra robust." The individual characters must be printed one at a time using *print*, since they may be unprintable.

The conversion from control sequence to byte sequence for encTEXis implemented here. Of course, the simplest way is to implement an array of string pointers with *hash_size* length, but we assume that only a few control sequences will need to be converted. So *mubyte_cswrite*, an array with only 128 items, is used. The items point to the token lists. First token includes a csname number and the second points the string to be output. The third token includes the number of another csname and fourth token its pointer to the string etc. We need to do the sequential searching in one of the 128 token lists.

```
⟨ Basic printing procedures 57 ⟩ +≡
procedure print_cs(p : integer); { prints a purported control sequence }
  var q: pointer; s: str_number;
  begin if active_noconvert ∧ (¬no_convert) ∧ (eq_type(p) = let) ∧ (equiv(p) = normal + 11) then
        { noconvert }
    begin no_convert ← true; return;
    end;
  s ← 0;
  if cs_converting ∧ (¬no_convert) then
    begin q ← mubyte_cswrite[p mod 128];
    while q ≠ null do
      if info(q) = p then
        begin s ← info(link(q)); q ← null;
        end
      else q ← link(link(q));
    end;
  no_convert ← false;
  if s > 0 then print(s)
  else if p < hash_base then { single character }
      if p ≥ single_base then
        if p = null_cs then
          begin print_esc("csname"); print_esc("endcsname"); print_char("␣");
          end
        else begin print_esc(p − single_base);
          if cat_code(p − single_base) = letter then print_char("␣");
          end
      else if p < active_base then print_esc("IMPOSSIBLE.")
        else print(p − active_base)
    else if ((p ≥ undefined_control_sequence) ∧ (p ≤ eqtb_size)) ∨ (p > eqtb_top) then
        print_esc("IMPOSSIBLE.")
      else if (text(p) ≥ str_ptr) then print_esc("NONEXISTENT.")
        else begin print_esc(text(p)); print_char("␣");
          end;
exit: end;
```

265:* Many of TEX's primitives need no *equiv*, since they are identifiable by their *eq_type* alone. These primitives are loaded into the hash table as follows:

```
⟨ Put each of TEX's primitives into the hash table 226 ⟩ +≡
  primitive("␣", ex_space, 0);
  primitive("/", ital_corr, 0);
  primitive("accent", accent, 0);
  primitive("advance", advance, 0);
  primitive("afterassignment", after_assignment, 0);
  primitive("aftergroup", after_group, 0);
  primitive("begingroup", begin_group, 0);
  primitive("char", char_num, 0);
  primitive("csname", cs_name, 0);
  primitive("delimiter", delim_num, 0);
  primitive("divide", divide, 0);
  primitive("endcsname", end_cs_name, 0);
  if enctex_p then
    begin primitive("endmubyte", end_cs_name, 10);
    end;
  primitive("endgroup", end_group, 0); text(frozen_end_group) ← "endgroup";
  eqtb[frozen_end_group] ← eqtb[cur_val];
  primitive("expandafter", expand_after, 0);
  primitive("font", def_font, 0);
  primitive("fontdimen", assign_font_dimen, 0);
  primitive("halign", halign, 0);
  primitive("hrule", hrule, 0);
  primitive("ignorespaces", ignore_spaces, 0);
  primitive("insert", insert, 0);
  primitive("mark", mark, 0);
  primitive("mathaccent", math_accent, 0);
  primitive("mathchar", math_char_num, 0);
  primitive("mathchoice", math_choice, 0);
  primitive("multiply", multiply, 0);
  primitive("noalign", no_align, 0);
  primitive("noboundary", no_boundary, 0);
  primitive("noexpand", no_expand, 0);
  primitive("nonscript", non_script, 0);
  primitive("omit", omit, 0);
  primitive("parshape", set_shape, 0);
  primitive("penalty", break_penalty, 0);
  primitive("prevgraf", set_prev_graf, 0);
  primitive("radical", radical, 0);
  primitive("read", read_to_cs, 0);
  primitive("relax", relax, 256);  { cf. scan_file_name }
  text(frozen_relax) ← "relax"; eqtb[frozen_relax] ← eqtb[cur_val];
  primitive("setbox", set_box, 0);
  primitive("the", the, 0);
  primitive("toks", toks_register, 0);
  primitive("vadjust", vadjust, 0);
  primitive("valign", valign, 0);
  primitive("vcenter", vcenter, 0);
  primitive("vrule", vrule, 0);
```

266.* Each primitive has a corresponding inverse, so that it is possible to display the cryptic numeric contents of *eqtb* in symbolic form. Every call of *primitive* in this program is therefore accompanied by some straightforward code that forms part of the *print_cmd_chr* routine below.

```
⟨ Cases of print_cmd_chr for symbolic printing of primitives 227 ⟩ +≡
accent: print_esc("accent");
advance: print_esc("advance");
after_assignment: print_esc("afterassignment");
after_group: print_esc("aftergroup");
assign_font_dimen: print_esc("fontdimen");
begin_group: print_esc("begingroup");

set_shape: print_esc("parshape");
the: print_esc("the");
toks_register: print_esc("toks");
vadjust: print_esc("vadjust");
valign: print_esc("valign");
vcenter: print_esc("vcenter");
vrule: print_esc("vrule");
```

271:* ⟨ Global variables 13 ⟩ +≡
```
save_stack: ↑memory_word;
save_ptr: 0 .. save_size;  { first unused entry on save_stack }
max_save_stack: 0 .. save_size;  { maximum usage of save stack }
cur_level: quarterword;  { current nesting level for groups }
cur_group: group_code;  { current group type }
cur_boundary: 0 .. save_size;  { where the current level begins }
```

283:* A global definition, which sets the level to *level_one*, will not be undone by *unsave*. If at least one global definition of *eqtb*[*p*] has been carried out within the group that just ended, the last such definition will therefore survive.

⟨ Store *save_stack*[*save_ptr*] in *eqtb*[*p*], unless *eqtb*[*p*] holds a global value 283* ⟩ ≡
```
if (p < int_base) ∨ (p > eqtb_size) then
  if eq_level(p) = level_one then
    begin eq_destroy(save_stack[save_ptr]);  { destroy the saved value }
    stat if tracing_restores > 0 then restore_trace(p, "retaining");
    tats
    end
  else begin eq_destroy(eqtb[p]);  { destroy the current value }
    eqtb[p] ← save_stack[save_ptr];  { restore the saved value }
    stat if tracing_restores > 0 then restore_trace(p, "restoring");
    tats
    end
else if xeq_level[p] ≠ level_one then
    begin eqtb[p] ← save_stack[save_ptr]; xeq_level[p] ← l;
    stat if tracing_restores > 0 then restore_trace(p, "restoring");
    tats
    end
  else begin stat if tracing_restores > 0 then restore_trace(p, "retaining");
    tats
    end
```
This code is used in section 282.

290:* ⟨ Check the "constant" values for consistency 14 ⟩ +≡
if *cs_token_flag* + *eqtb_size* + *hash_extra* > *max_halfword* **then** *bad* ← 21;
if (*hash_offset* < 0) ∨ (*hash_offset* > *hash_base*) **then** *bad* ← 42;

301:* ⟨ Global variables 13 ⟩ +≡
input_stack: ↑*in_state_record*;
input_ptr: 0 .. *stack_size*; { first unused location of *input_stack* }
max_in_stack: 0 .. *stack_size*; { largest value of *input_ptr* when pushing }
cur_input: *in_state_record*; { the "top" input state, according to convention (1) }

304:* Additional information about the current line is available via the *index* variable, which counts how many lines of characters are present in the buffer below the current level. We have *index* = 0 when reading from the terminal and prompting the user for each line; then if the user types, e.g., '`\input paper`', we will have *index* = 1 while reading the file `paper.tex`. However, it does not follow that *index* is the same as the input stack pointer, since many of the levels on the input stack may come from token lists. For example, the instruction '`\input paper`' might occur in a token list.

The global variable *in_open* is equal to the *index* value of the highest non-token-list level. Thus, the number of partially read lines in the buffer is *in_open* + 1, and we have *in_open* = *index* when we are not reading a token list.

If we are not currently reading from the terminal, or from an input stream, we are reading from the file variable *input_file*[*index*]. We use the notation *terminal_input* as a convenient abbreviation for *name* = 0, and *cur_file* as an abbreviation for *input_file*[*index*].

The global variable *line* contains the line number in the topmost open file, for use in error messages. If we are not reading from the terminal, *line_stack*[*index*] holds the line number for the enclosing level, so that *line* can be restored when the current file has been read. Line numbers should never be negative, since the negative of the current line number is used to identify the user's output routine in the *mode_line* field of the semantic nest entries.

If more information about the input state is needed, it can be included in small arrays like those shown here. For example, the current page or segment number in the input file might be put into a variable *page*, maintained for enclosing levels in '*page_stack*: **array** [1 .. *max_in_open*] **of** *integer*' by analogy with *line_stack*.

define *terminal_input* ≡ (*name* = 0) { are we reading from the terminal? }
define *cur_file* ≡ *input_file*[*index*] { the current *alpha_file* variable }

⟨ Global variables 13 ⟩ +≡
in_open: 0 .. *max_in_open*; { the number of lines in the buffer, less one }
open_parens: 0 .. *max_in_open*; { the number of open text files }
input_file: ↑*alpha_file*;
line: *integer*; { current line number in the current source file }
line_stack: ↑*integer*;
source_filename_stack: ↑*str_number*;
full_source_filename_stack: ↑*str_number*;

306.* Here is a procedure that uses *scanner_status* to print a warning message when a subfile has ended, and at certain other crucial times:

```
⟨ Declare the procedure called runaway 306* ⟩ ≡
procedure runaway;
  var p: pointer; { head of runaway list }
  begin if scanner_status > skipping then
    begin case scanner_status of
    defining: begin print_nl("Runaway␣definition"); p ← def_ref;
      end;
    matching: begin print_nl("Runaway␣argument"); p ← temp_head;
      end;
    aligning: begin print_nl("Runaway␣preamble"); p ← hold_head;
      end;
    absorbing: begin print_nl("Runaway␣text"); p ← def_ref;
      end;
    end; { there are no other cases }
    print_char("?"); print_ln; show_token_list(link(p), null, error_line − 10);
    end;
  end;
```

This code is used in section 119.

308.* The *param_stack* is an auxiliary array used to hold pointers to the token lists for parameters at the current level and subsidiary levels of input. This stack is maintained with convention (2), and it grows at a different rate from the others.

```
⟨ Global variables 13 ⟩ +≡
param_stack: ↑pointer; { token list pointers for parameters }
param_ptr: 0 .. param_size; { first unused entry in param_stack }
max_param_stack: integer; { largest value of param_ptr, will be ≤ param_size + 9 }
```

318.* But the trick is distracting us from our current goal, which is to understand the input state. So let's concentrate on the data structures that are being pseudoprinted as we finish up the *show_context* procedure.

```
⟨ Pseudoprint the line 318* ⟩ ≡
  begin_pseudoprint;
  if buffer[limit] = end_line_char then j ← limit
  else j ← limit + 1; { determine the effective end of the line }
  i ← start; mubyte_skeep ← mubyte_keep; mubyte_sstart ← mubyte_start; mubyte_start ← false;
  if j > 0 then
    while i < j do
      begin if i = loc then set_trick_count;
      print_buffer(i);
      end;
  mubyte_keep ← mubyte_skeep; mubyte_start ← mubyte_sstart
```

This code is used in section 312.

328.* The *begin_file_reading* procedure starts a new level of input for lines of characters to be read from a file, or as an insertion from the terminal. It does not take care of opening the file, nor does it set *loc* or *limit* or *line*.

```
procedure begin_file_reading;
  begin if in_open = max_in_open then overflow("text␣input␣levels", max_in_open);
  if first = buf_size then overflow("buffer␣size", buf_size);
  incr(in_open); push_input; index ← in_open; source_filename_stack[index] ← 0;
  full_source_filename_stack[index] ← 0; line_stack[index] ← line; start ← first; state ← mid_line;
  name ← 0;  { terminal_input is now true }
  end;
```

331.* To get TEX's whole input mechanism going, we perform the following actions.

```
⟨ Initialize the input routines 331* ⟩ ≡
  begin input_ptr ← 0; max_in_stack ← 0; source_filename_stack[0] ← 0;
  full_source_filename_stack[0] ← 0; in_open ← 0; open_parens ← 0; max_buf_stack ← 0; param_ptr ← 0;
  max_param_stack ← 0; first ← buf_size;
  repeat buffer[first] ← 0; decr(first);
  until first = 0;
  scanner_status ← normal; warning_index ← null; first ← 1; state ← new_line; start ← 1; index ← 0;
  line ← 0; name ← 0; force_eof ← false; align_state ← 1000000;
  if ¬init_terminal then goto final_end;
  limit ← last; first ← last + 1;  { init_terminal has set loc and last }
  end
```

This code is used in section 1337*.

332* Getting the next token. The heart of TEX's input mechanism is the *get_next* procedure, which we shall develop in the next few sections of the program. Perhaps we shouldn't actually call it the "heart," however, because it really acts as TEX's eyes and mouth, reading the source files and gobbling them up. And it also helps TEX to regurgitate stored token lists that are to be processed again.

The main duty of *get_next* is to input one token and to set *cur_cmd* and *cur_chr* to that token's command code and modifier. Furthermore, if the input token is a control sequence, the *eqtb* location of that control sequence is stored in *cur_cs*; otherwise *cur_cs* is set to zero.

Underlying this simple description is a certain amount of complexity because of all the cases that need to be handled. However, the inner loop of *get_next* is reasonably short and fast.

When *get_next* is asked to get the next token of a `\read` line, it sets $cur\_cmd = cur\_chr = cur\_cs = 0$ in the case that no more tokens appear on that line. (There might not be any tokens at all, if the *end_line_char* has *ignore* as its catcode.)

Some additional routines used by the encTEXextension have to be declared at this point.

⟨ Declare additional routines for encTEX 1410* ⟩

338* ⟨ Tell the user what has run away and try to recover 338* ⟩ ≡

```
begin runaway; { print a definition, argument, or preamble }
if cur_cs = 0 then print_err("File␣ended")
else begin cur_cs ← 0; print_err("Forbidden␣control␣sequence␣found");
  end;
⟨ Print either 'definition' or 'use' or 'preamble' or 'text', and insert tokens that should lead to
    recovery 339* ⟩;
print("␣of␣"); sprint_cs(warning_index);
help4("I␣suspect␣you␣have␣forgotten␣a␣`}´,␣causing␣me")
("to␣read␣past␣where␣you␣wanted␣me␣to␣stop.")
("I´ll␣try␣to␣recover;␣but␣if␣the␣error␣is␣serious,")
("you´d␣better␣type␣`E´␣or␣`X´␣now␣and␣fix␣your␣file.");
error;
end
```

This code is used in section 336.

339* The recovery procedure can't be fully understood without knowing more about the TEX routines that should be aborted, but we can sketch the ideas here: For a runaway definition or a runaway balanced text we will insert a right brace; for a runaway preamble, we will insert a special `\cr` token and a right brace; and for a runaway argument, we will set *long_state* to *outer_call* and insert `\par`.

⟨ Print either 'definition' or 'use' or 'preamble' or 'text', and insert tokens that should lead to recovery 339* ⟩ ≡

```
p ← get_avail;
case scanner_status of
defining: begin print("␣while␣scanning␣definition"); info(p) ← right_brace_token + "}";
  end;
matching: begin print("␣while␣scanning␣use"); info(p) ← par_token; long_state ← outer_call;
  end;
aligning: begin print("␣while␣scanning␣preamble"); info(p) ← right_brace_token + "}"; q ← p;
  p ← get_avail; link(p) ← q; info(p) ← cs_token_flag + frozen_cr; align_state ← −1000000;
  end;
absorbing: begin print("␣while␣scanning␣text"); info(p) ← right_brace_token + "}";
  end;
end; { there are no other cases }
ins_list(p)
```

This code is used in section 338*.

341.* Now we're ready to take the plunge into *get_next* itself. Parts of this routine are executed more often than any other instructions of TEX.

```
define switch = 25  { a label in get_next }
define start_cs = 26  { another }
procedure get_next;  { sets cur_cmd, cur_chr, cur_cs to next token }
  label restart,  { go here to get the next input token }
    switch,  { go here to eat the next character from a file }
    reswitch,  { go here to digest it again }
    start_cs,  { go here to start looking for a control sequence }
    found,  { go here when a control sequence has been found }
    exit;  { go here when the next input token has been got }
  var k: 0 .. buf_size;  { an index into buffer }
    t: halfword;  { a token }
    i, j: 0 .. buf_size;  { more indexes for encTeX }
    mubyte_incs: boolean;  { control sequence is converted by mubyte }
    p: pointer;  { for encTeX test if noexpanding }
    cat: 0 .. max_char_code;  { cat_code(cur_chr), usually }
    c, cc: ASCII_code;  { constituents of a possible expanded code }
    d: 2 .. 3;  { number of excess characters in an expanded code }
  begin restart: cur_cs ← 0;
  if state ≠ token_list then ⟨ Input from external file, goto restart if no input found 343* ⟩
  else ⟨ Input from token list, goto restart if end of list or if a parameter needs to be expanded 357* ⟩;
  ⟨ If an alignment entry has just ended, take appropriate action 342 ⟩;
exit: end;
```

343.* ⟨ Input from external file, **goto** *restart* if no input found 343* ⟩ ≡

```
begin switch: if loc ≤ limit then  { current line not yet finished }
    begin  { Use k instead of loc for type correctness. }
    k ← loc; cur_chr ← read_buffer(k); loc ← k; incr(loc);
    if (mubyte_token > 0) then
      begin state ← mid_line; cur_cs ← mubyte_token − cs_token_flag; goto found;
      end;
  reswitch: cur_cmd ← cat_code(cur_chr); ⟨ Change state if necessary, and goto switch if the current
      character should be ignored, or goto reswitch if the current character changes to another 344 ⟩;
    end
  else begin state ← new_line;
    ⟨ Move to next line of file, or goto restart if there is no next line, or return if a \read line has
      finished 360 ⟩;
    check_interrupt; goto switch;
    end;
  end
```

This code is used in section 341*.

354:* Control sequence names are scanned only when they appear in some line of a file; once they have been scanned the first time, their *eqtb* location serves as a unique identification, so TEX doesn't need to refer to the original name any more except when it prints the equivalent in symbolic form.

The program that scans a control sequence has been written carefully in order to avoid the blowups that might otherwise occur if a malicious user tried something like '`\catcode´15=0`'. The algorithm might look at $buffer[limit+1]$, but it never looks at $buffer[limit+2]$.

If expanded characters like '`^^A`' or '`^^df`' appear in or just following a control sequence name, they are converted to single characters in the buffer and the process is repeated, slowly but surely.

```
⟨ Scan a control sequence and set state ← skip_blanks or mid_line 354* ⟩ ≡
  begin if loc > limit then cur_cs ← null_cs { state is irrelevant in this case }
  else begin start_cs: mubyte_incs ← false; k ← loc; mubyte_skeep ← mubyte_keep;
    cur_chr ← read_buffer(k); cat ← cat_code(cur_chr);
    if (mubyte_in > 0) ∧ (¬mubyte_incs) ∧ ((mubyte_skip > 0) ∨ (cur_chr ≠ buffer[k])) then
      mubyte_incs ← true;
    incr(k);
    if mubyte_token > 0 then
      begin state ← mid_line; cur_cs ← mubyte_token − cs_token_flag; goto found;
      end;
    if cat = letter then state ← skip_blanks
    else if cat = spacer then state ← skip_blanks
      else state ← mid_line;
    if (cat = letter) ∧ (k ≤ limit) then ⟨ Scan ahead in the buffer until finding a nonletter; if an expanded
        code is encountered, reduce it and goto start_cs; otherwise if a multiletter control sequence is
        found, adjust cur_cs and loc, and goto found 356* ⟩
    else ⟨ If an expanded code is present, reduce it and goto start_cs 355* ⟩;
    mubyte_keep ← mubyte_skeep; cur_cs ← single_base + read_buffer(loc); incr(loc);
    end;
found: cur_cmd ← eq_type(cur_cs); cur_chr ← equiv(cur_cs);
  if cur_cmd ≥ outer_call then check_outer_validity;
  if write_noexpanding then
    begin p ← mubyte_cswrite[cur_cs mod 128];
    while p ≠ null do
      if info(p) = cur_cs then
        begin cur_cmd ← relax; cur_chr ← 256; p ← null;
        end
      else p ← link(link(p));
    end;
  end
```

This code is used in section 344.

355.* Whenever we reach the following piece of code, we will have $cur\_chr = buffer[k-1]$ and $k \le limit+1$ and $cat = cat\_code(cur\_chr)$. If an expanded code like `^^A` or `^^df` appears in $buffer[(k-1)\,..\,(k+1)]$ or $buffer[(k-1)\,..\,(k+2)]$, we will store the corresponding code in $buffer[k-1]$ and shift the rest of the buffer left two or three places.

```
⟨ If an expanded code is present, reduce it and goto start_cs 355* ⟩ ≡
  begin if buffer[k] = cur_chr then if cat = sup_mark then if k < limit then
      begin c ← buffer[k + 1]; if c < ´200 then { yes, one is indeed present }
        begin d ← 2;
        if is_hex(c) then if k + 2 ≤ limit then
            begin cc ← buffer[k + 2]; if is_hex(cc) then incr(d);
            end;
        if d > 2 then
          begin hex_to_cur_chr; buffer[k − 1] ← cur_chr;
          end
        else if c < ´100 then buffer[k − 1] ← c + ´100
          else buffer[k − 1] ← c − ´100;
        limit ← limit − d; first ← first − d;
        if mubyte_in > 0 then mubyte_keep ← k − loc;
        while k ≤ limit do
          begin buffer[k] ← buffer[k + d]; incr(k);
          end;
        goto start_cs;
        end;
      end;
  end
```

This code is used in sections 354* and 356*.

356.* ⟨ Scan ahead in the buffer until finding a nonletter; if an expanded code is encountered, reduce it and **goto** *start_cs*; otherwise if a multiletter control sequence is found, adjust *cur_cs* and *loc*, and **goto** *found* 356* ⟩ ≡

```
begin repeat cur_chr ← read_buffer(k); cat ← cat_code(cur_chr);
  if mubyte_token > 0 then cat ← escape;
  if (mubyte_in > 0) ∧ (¬mubyte_incs) ∧ (cat = letter) ∧ ((mubyte_skip > 0) ∨ (cur_chr ≠ buffer[k]))
      then mubyte_incs ← true;
  incr(k);
until (cat ≠ letter) ∨ (k > limit);
⟨ If an expanded code is present, reduce it and goto start_cs 355* ⟩;
if cat ≠ letter then
  begin decr(k); k ← k − mubyte_skip;
  end;
if k > loc + 1 then { multiletter control sequence has been scanned }
  begin if mubyte_incs then { multibyte in csname occurrs }
    begin i ← loc; j ← first; mubyte_keep ← mubyte_skeep;
    if j − loc + k > max_buf_stack then
      begin max_buf_stack ← j − loc + k;
      if max_buf_stack ≥ buf_size then
        begin max_buf_stack ← buf_size; overflow("buffer␣size", buf_size);
        end;
      end;
    while i < k do
      begin buffer[j] ← read_buffer(i); incr(i); incr(j);
      end;
    if j = first + 1 then cur_cs ← single_base + buffer[first]
    else cur_cs ← id_lookup(first, j − first);
    end
  else cur_cs ← id_lookup(loc, k − loc);
  loc ← k; goto found;
  end;
end
```

This code is used in section 354*.

357*. Let's consider now what happens when *get_next* is looking at a token list.

```
⟨ Input from token list, goto restart if end of list or if a parameter needs to be expanded 357* ⟩ ≡
  if loc ≠ null then { list not exhausted }
    begin t ← info(loc); loc ← link(loc); { move to next }
    if t ≥ cs_token_flag then { a control sequence token }
      begin cur_cs ← t − cs_token_flag; cur_cmd ← eq_type(cur_cs); cur_chr ← equiv(cur_cs);
      if cur_cmd ≥ outer_call then
        if cur_cmd = dont_expand then ⟨ Get the next token, suppressing expansion 358 ⟩
        else check_outer_validity;
      if write_noexpanding then
        begin p ← mubyte_cswrite[cur_cs mod 128];
        while p ≠ null do
          if info(p) = cur_cs then
            begin cur_cmd ← relax; cur_chr ← 256; p ← null;
            end
          else p ← link(link(p));
        end;
      end
    else begin cur_cmd ← t div ´400; cur_chr ← t mod ´400;
      case cur_cmd of
      left_brace: incr(align_state);
      right_brace: decr(align_state);
      out_param: ⟨ Insert macro parameter and goto restart 359 ⟩;
      othercases do_nothing
      endcases;
      end;
    end
  else begin { we are done with this token list }
    end_token_list; goto restart; { resume previous level }
    end
```

This code is used in section 341*.

363:* If the user has set the *pausing* parameter to some positive value, and if nonstop mode has not been selected, each line of input is displayed on the terminal and the transcript file, followed by '`=>`'. TEX waits for a response. If the response is simply *carriage_return*, the line is accepted as it stands, otherwise the line typed is used instead of the line in the file.

```
procedure firm_up_the_line;
  var k: 0 .. buf_size;  { an index into buffer }
  begin limit ← last;
  if pausing > 0 then
    if interaction > nonstop_mode then
      begin wake_up_terminal; print_ln; k ← start;
      while k < limit do
        begin print_buffer(k)
        end;
      first ← limit; prompt_input("=>");  { wait for user response }
      if last > first then
        begin for k ← first to last − 1 do  { move line down in buffer }
          buffer[k + start − first] ← buffer[k];
        limit ← start + last − first;
        end;
      end;
  end;
```

366.* Expanding the next token. Only a dozen or so command codes > *max_command* can possibly be returned by *get_next*; in increasing order, they are *undefined_cs*, *expand_after*, *no_expand*, *input*, *if_test*, *fi_or_else*, *cs_name*, *convert*, *the*, *top_bot_mark*, *call*, *long_call*, *outer_call*, *long_outer_call*, and *end_template*.

The *expand* subroutine is used when *cur_cmd* > *max_command*. It removes a "call" or a conditional or one of the other special operations just listed. It follows that *expand* might invoke itself recursively. In all cases, *expand* destroys the current token, but it sets things up so that the next *get_next* will deliver the appropriate next token. The value of *cur_tok* need not be known when *expand* is called.

Since several of the basic scanning routines communicate via global variables, their values are saved as local variables of *expand* so that recursive calls don't invalidate them.

```
⟨ Declare the procedure called macro_call 389 ⟩
⟨ Declare the procedure called insert_relax 379 ⟩
procedure pass_text; forward;
procedure start_input; forward;
procedure conditional; forward;
procedure get_x_token; forward;
procedure conv_toks; forward;
procedure ins_the_toks; forward;
procedure expand;
  var t: halfword; { token that is being "expanded after" }
    p, q, r: pointer; { for list manipulation }
    j: 0 .. buf_size; { index into buffer }
    cv_backup: integer; { to save the global quantity cur_val }
    cvl_backup, radix_backup, co_backup: small_number; { to save cur_val_level, etc. }
    backup_backup: pointer; { to save link(backup_head) }
    save_scanner_status: small_number; { temporary storage of scanner_status }
  begin incr(expand_depth_count);
  if expand_depth_count ≥ expand_depth then overflow("expansion␣depth", expand_depth);
  cv_backup ← cur_val; cvl_backup ← cur_val_level; radix_backup ← radix; co_backup ← cur_order;
  backup_backup ← link(backup_head);
  if cur_cmd < call then ⟨ Expand a nonmacro 367 ⟩
  else if cur_cmd < end_template then macro_call
    else ⟨ Insert a token containing frozen_endv 375 ⟩;
  cur_val ← cv_backup; cur_val_level ← cvl_backup; radix ← radix_backup; cur_order ← co_backup;
  link(backup_head) ← backup_backup; decr(expand_depth_count);
  end;
```

372.* ⟨ Manufacture a control sequence name 372* ⟩ ≡

```
  begin r ← get_avail; p ← r; { head of the list of characters }
  repeat get_x_token;
    if cur_cs = 0 then store_new_token(cur_tok);
  until cur_cs ≠ 0;
  if (cur_cmd ≠ end_cs_name) ∨ (cur_chr ≠ 0) then ⟨ Complain about missing \endcsname 373 ⟩;
  ⟨ Look up the characters of list r in the hash table, and set cur_cs 374 ⟩;
  flush_list(r);
  if eq_type(cur_cs) = undefined_cs then
    begin eq_define(cur_cs, relax, 256); { N.B.: The save_stack might change }
    end; { the control sequence will now match '\relax' }
  cur_tok ← cur_cs + cs_token_flag; back_input;
  end
```

This code is used in section 367.

414:* ⟨ Fetch a character code from some table 414* ⟩ ≡

```
begin scan_char_num;
if m = xord_code_base then scanned_result(xord[cur_val])(int_val)
else if m = xchr_code_base then scanned_result(xchr[cur_val])(int_val)
  else if m = xprn_code_base then scanned_result(xprn[cur_val])(int_val)
    else if m = math_code_base then scanned_result(ho(math_code(cur_val)))(int_val)
      else if m < math_code_base then scanned_result(equiv(m + cur_val))(int_val)
        else scanned_result(eqtb[m + cur_val].int)(int_val);
end
```

This code is used in section 413.

484:* Here we input on-line into the *buffer* array, prompting the user explicitly if $n \geq 0$. The value of n is set negative so that additional prompts will not be given in the case of multi-line input.

```
⟨ Input for \read from the terminal 484* ⟩ ≡
  if interaction > nonstop_mode then
    if n < 0 then prompt_input("")
    else begin wake_up_terminal; print_ln; sprint_cs(r); prompt_input("="); n ← −1;
      end
  else begin limit ← 0; fatal_error("***␣(cannot␣\read␣from␣terminal␣in␣nonstop␣modes)");
    end
```

This code is used in section 483.

501:* ⟨ Either process `\ifcase` or set b to the value of a boolean condition 501* ⟩ ≡

```

end { there are no other cases }
```

This code is used in section 498.

513.* The file names we shall deal with have the following structure: If the name contains '`/`' or '`:`' (for Amiga only), the file area consists of all characters up to and including the final such character; otherwise the file area is null. If the remaining file name contains '`.`', the file extension consists of all such characters from the last '`.`' to the end, otherwise the file extension is null.

We can scan such file names easily by using two global variables that keep track of the occurrences of area and extension delimiters:

⟨ Global variables 13 ⟩ +≡
area_delimiter: *pool_pointer*; { the most recent '`/`', if any }
ext_delimiter: *pool_pointer*; { the most recent '`.`', if any }

514.* Input files that can't be found in the user's area may appear in a standard system area called *TEX_area*. Font metric files whose areas are not given explicitly are assumed to appear in a standard system area called *TEX_font_area*. These system area names will, of course, vary from place to place.

In C, the default paths are specified separately.

515.* Here now is the first of the system-dependent routines for file name scanning.

```
procedure begin_name;
  begin area_delimiter ← 0; ext_delimiter ← 0; quoted_filename ← false;
  end;
```

516.* And here's the second. The string pool might change as the file name is being scanned, since a new `\csname` might be entered; therefore we keep *area_delimiter* and *ext_delimiter* relative to the beginning of the current string, instead of assigning an absolute address like *pool_ptr* to them.

```
function more_name(c : ASCII_code): boolean;
  begin if (c = "␣") ∧ stop_at_space ∧ (¬quoted_filename) then more_name ← false
  else if c = """" then
      begin quoted_filename ← ¬quoted_filename; more_name ← true;
      end
    else begin str_room(1); append_char(c); { contribute c to the current string }
      if IS_DIR_SEP(c) then
        begin area_delimiter ← cur_length; ext_delimiter ← 0;
        end
      else if c = "." then ext_delimiter ← cur_length;
      more_name ← true;
      end;
  end;
```

517:* The third. If a string is already in the string pool, the function *slow_make_string* does not create a new string but returns this string number, thus saving string space. Because of this new property of the returned string number it is not possible to apply *flush_string* to these strings.

```
procedure end_name;
  var temp_str: str_number;  { result of file name cache lookups }
    j, s, t: pool_pointer;  { running indices }
    must_quote: boolean;  { whether we need to quote a string }
  begin if str_ptr + 3 > max_strings then overflow("number␣of␣strings", max_strings − init_str_ptr);
  str_room(6);  { Room for quotes, if needed. }
    { add quotes if needed }
  if area_delimiter ≠ 0 then
    begin  { maybe quote cur_area }
    must_quote ← false; s ← str_start[str_ptr]; t ← str_start[str_ptr] + area_delimiter; j ← s;
    while (¬must_quote) ∧ (j < t) do
      begin must_quote ← str_pool[j] = "␣"; incr(j);
      end;
    if must_quote then

  temp_str ← search_string(cur_name);
  if temp_str > 0 then
    begin cur_name ← temp_str; decr(str_ptr); { no flush_string, pool_ptr will be wrong! }
    for j ← str_start[str_ptr + 1] to pool_ptr − 1 do
      begin str_pool[j − ext_delimiter + area_delimiter + 1] ← str_pool[j];
      end;
    pool_ptr ← pool_ptr − ext_delimiter + area_delimiter + 1; { update pool_ptr }
    end;
  cur_ext ← slow_make_string; { remake extension string }
  end;
end;
```

518.* Conversely, here is a routine that takes three strings and prints a file name that might have produced them. (The routine is system dependent, because some operating systems put the file area last instead of first.)

```
define check_quoted(#) ≡ { check if string # needs quoting }
    if # ≠ 0 then
      begin j ← str_start[#];
      while (¬must_quote) ∧ (j < str_start[# + 1]) do
        begin must_quote ← str_pool[j] = "␣"; incr(j);
        end;
      end
define print_quoted(#) ≡ { print string #, omitting quotes }
    if # ≠ 0 then
      for j ← str_start[#] to str_start[# + 1] − 1 do
        if so(str_pool[j]) ≠ """" then print(so(str_pool[j]))
⟨ Basic printing procedures 57 ⟩ +≡
procedure print_file_name(n, a, e : integer);
  var must_quote: boolean; { whether to quote the filename }
    j: pool_pointer; { index into str_pool }
  begin must_quote ← false; check_quoted(a); check_quoted(n);
  check_quoted(e); { FIXME: Alternative is to assume that any filename that has to be quoted has at least
      one quoted component...if we pick this, a number of insertions of print_file_name should go away.
      must_quote:=((a¡¿0)and(str_pool[str_start[a]]=""""))or ((n¡¿0)and(str_pool[str_start[n]]=""""))or
      ((e¡¿0)and(str_pool[str_start[e]]=""""));}
  if must_quote then print_char("""");
  print_quoted(a); print_quoted(n); print_quoted(e);
  if must_quote then print_char("""");
  end;
```

519.* Another system-dependent routine is needed to convert three internal TEX strings into the *name_of_file* value that is used to open files. The present code allows both lowercase and uppercase letters in the file name.

```
define append_to_name(#) ≡
    begin c ← #;
    if ¬(c = """") then
      begin incr(k);
      if k ≤ file_name_size then name_of_file[k] ← xchr[c];
      end
    end
procedure pack_file_name(n, a, e : str_number);
  var k: integer; { number of positions filled in name_of_file }
    c: ASCII_code; { character being packed }
    j: pool_pointer; { index into str_pool }
  begin k ← 0;
  if name_of_file then libc_free(name_of_file);
  name_of_file ← xmalloc_array(ASCII_code, length(a) + length(n) + length(e) + 1);
  for j ← str_start[a] to str_start[a + 1] − 1 do append_to_name(so(str_pool[j]));
  for j ← str_start[n] to str_start[n + 1] − 1 do append_to_name(so(str_pool[j]));
  for j ← str_start[e] to str_start[e + 1] − 1 do append_to_name(so(str_pool[j]));
  if k ≤ file_name_size then name_length ← k else name_length ← file_name_size;
  name_of_file[name_length + 1] ← 0;
  end;
```

520.* A messier routine is also needed, since format file names must be scanned before TEX's string mechanism has been initialized. We shall use the global variable *TEX_format_default* to supply the text for default system areas and extensions related to format files.

Under UNIX we don't give the area part, instead depending on the path searching that will happen during file opening. Also, the length will be set in the main program.

```
define format_area_length = 0  { length of its area part }
define format_ext_length = 4  { length of its '.fmt' part }
define format_extension = ".fmt"  { the extension, as a WEB constant }
```

⟨ Global variables 13 ⟩ +≡
```
format_default_length: integer;
TEX_format_default: cstring;
```

521.* We set the name of the default format file and the length of that name in C, instead of Pascal, since we want them to depend on the name of the program.

523.* Here is the messy routine that was just mentioned. It sets *name_of_file* from the first n characters of *TEX_format_default*, followed by *buffer*[a .. b], followed by the last *format_ext_length* characters of *TEX_format_default*.

We dare not give error messages here, since TEX calls this routine before the *error* routine is ready to roll. Instead, we simply drop excess characters, since the error will be detected in another way when a strange file name isn't found.

```
procedure pack_buffered_name(n : small_number; a, b : integer);
  var k: integer;  { number of positions filled in name_of_file }
    c: ASCII_code;  { character being packed }
    j: integer;  { index into buffer or TEX_format_default }
  begin if n + b − a + 1 + format_ext_length > file_name_size then
    b ← a + file_name_size − n − 1 − format_ext_length;
  k ← 0;
  if name_of_file then libc_free(name_of_file);
  name_of_file ← xmalloc_array(ASCII_code, n + (b − a + 1) + format_ext_length + 1);
  for j ← 1 to n do append_to_name(xord[ucharcast(TEX_format_default[j])]);
  for j ← a to b do append_to_name(buffer[j]);
  for j ← format_default_length − format_ext_length + 1 to format_default_length do
    append_to_name(xord[ucharcast(TEX_format_default[j])]);
  if k ≤ file_name_size then name_length ← k else name_length ← file_name_size;
  name_of_file[name_length + 1] ← 0;
  end;
```

524:* Here is the only place we use *pack_buffered_name*. This part of the program becomes active when a "virgin" TEX is trying to get going, just after the preliminary initialization, or when the user is substituting another format file by typing '`&`' after the initial '`**`' prompt. The buffer contains the first line of input in *buffer*[*loc* .. (*last* − 1)], where *loc* < *last* and *buffer*[*loc*] ≠ "␣".

⟨ Declare the function called *open_fmt_file* 524* ⟩ ≡

```
function open_fmt_file: boolean;
  label found, exit;
  var j: 0 .. buf_size;  { the first space after the format file name }
  begin j ← loc;
  if buffer[loc] = "&" then
    begin incr(loc); j ← loc; buffer[last] ← "␣";
    while buffer[j] ≠ "␣" do incr(j);
    pack_buffered_name(0, loc, j − 1);  { Kpathsea does everything }
    if w_open_in(fmt_file) then goto found;
    wake_up_terminal; wterm('Sorry,␣I␣can't␣find␣the␣format␣`');
    fputs(stringcast(name_of_file + 1), stdout); wterm('';␣will␣try␣`');
    fputs(TEX_format_default + 1, stdout); wterm_ln('.'); update_terminal;
    end;  { now pull out all the stops: try for the system plain file }
  pack_buffered_name(format_default_length − format_ext_length, 1, 0);
  if ¬w_open_in(fmt_file) then
    begin wake_up_terminal; wterm('I␣can't␣find␣the␣format␣file␣`');
    fputs(TEX_format_default + 1, stdout); wterm_ln('!'); open_fmt_file ← false; return;
    end;
found: loc ← j; open_fmt_file ← true;
exit: end;
```

This code is used in section 1303*.

525:* Operating systems often make it possible to determine the exact name (and possible version number) of a file that has been opened. The following routine, which simply makes a TEX string from the value of *name_of_file*, should ideally be changed to deduce the full name of file f, which is the file most recently opened, if it is possible to do this in a Pascal program.

This routine might be called after string memory has overflowed, hence we dare not use '*str_room*'.

```
function make_name_string: str_number;
  var k: 1 .. file_name_size;  { index into name_of_file }
    save_area_delimiter, save_ext_delimiter: pool_pointer;
    save_name_in_progress, save_stop_at_space: boolean;
  begin if (pool_ptr + name_length > pool_size) ∨ (str_ptr = max_strings) ∨ (cur_length > 0) then
    make_name_string ← "?"
  else begin for k ← 1 to name_length do append_char(xord[name_of_file[k]]);
    make_name_string ← make_string;  { At this point we also set cur_name, cur_ext, and cur_area to
        match the contents of name_of_file. }
    save_area_delimiter ← area_delimiter; save_ext_delimiter ← ext_delimiter;
    save_name_in_progress ← name_in_progress; save_stop_at_space ← stop_at_space;
    name_in_progress ← true; begin_name; stop_at_space ← false; k ← 1;
    while (k ≤ name_length) ∧ (more_name(name_of_file[k])) do incr(k);
    stop_at_space ← save_stop_at_space; end_name; name_in_progress ← save_name_in_progress;
    area_delimiter ← save_area_delimiter; ext_delimiter ← save_ext_delimiter;
    end;
  end;
function a_make_name_string(var f : alpha_file): str_number;
  begin a_make_name_string ← make_name_string;
  end;
function b_make_name_string(var f : byte_file): str_number;
  begin b_make_name_string ← make_name_string;
  end;
function w_make_name_string(var f : word_file): str_number;
  begin w_make_name_string ← make_name_string;
  end;
```

526.* Now let's consider the "driver" routines by which TEX deals with file names in a system-independent manner. First comes a procedure that looks for a file name in the input by calling *get_x_token* for the information.

```
procedure scan_file_name;
  label done;
  var save_warning_index: pointer;
  begin save_warning_index ← warning_index; warning_index ← cur_cs;
      { store cur_cs here to remember until later }
  ⟨ Get the next non-blank non-relax non-call token 404 ⟩;
      { here the program expands tokens and removes spaces and \relaxes from the input. The \relax
      removal follows LuaTeX"s implementation, and other cases of balanced text scanning. }
  back_input; { return the last token to be read by either code path }
  if cur_cmd = left_brace then scan_file_name_braced
  else begin name_in_progress ← true; begin_name; ⟨ Get the next non-blank non-call token 406 ⟩;
    loop begin if (cur_cmd > other_char) ∨ (cur_chr > 255) then { not a character }
        begin back_input; goto done;
        end; { If cur_chr is a space and we're not scanning a token list, check whether we're at the end
            of the buffer. Otherwise we end up adding spurious spaces to file names in some cases. }
      if (cur_chr = "␣") ∧ (state ≠ token_list) ∧ (loc > limit) then goto done;
      if ¬more_name(cur_chr) then goto done;
      get_x_token;
      end;
    end;
done: end_name; name_in_progress ← false; warning_index ← save_warning_index;
      { restore warning_index }
  end;
```

530:* If some trouble arises when TEX tries to open a file, the following routine calls upon the user to supply another file name. Parameter s is used in the error message to identify the type of file; parameter e is the default extension if none is given. Upon exit from the routine, variables *cur_name*, *cur_area*, *cur_ext*, and *name_of_file* are ready for another attempt at file opening.

```
procedure prompt_file_name(s, e : str_number);
  label done;
  var k: 0 .. buf_size;  { index into buffer }
    saved_cur_name: str_number;  { to catch empty terminal input }
    saved_cur_ext: str_number;  { to catch empty terminal input }
    saved_cur_area: str_number;  { to catch empty terminal input }
  begin if interaction = scroll_mode then wake_up_terminal;
  if s = "input␣file␣name" then print_err("I␣can´t␣find␣file␣`")
  else print_err("I␣can´t␣write␣on␣file␣`");
  print_file_name(cur_name, cur_area, cur_ext); print("´.");
  if (e = ".tex") ∨ (e = "") then show_context;
  print_ln; print_c_string(prompt_file_name_help_msg);
  if (e ≠ "") then
    begin print(";␣default␣file␣extension␣is␣`"); print(e); print("´");
    end;
  print(")"); print_ln; print_nl("Please␣type␣another␣"); print(s);
  if interaction < scroll_mode then fatal_error("***␣(job␣aborted,␣file␣error␣in␣nonstop␣mode)");
  saved_cur_name ← cur_name; saved_cur_ext ← cur_ext; saved_cur_area ← cur_area; clear_terminal;
  prompt_input(":␣"); ⟨ Scan file name in the buffer 531 ⟩;
  if (length(cur_name) = 0) ∧ (cur_ext = "") ∧ (cur_area = "") then
    begin cur_name ← saved_cur_name; cur_ext ← saved_cur_ext; cur_area ← saved_cur_area;
    end
  else if cur_ext = "" then cur_ext ← e;
  pack_cur_name;
  end;
```

532:* Here's an example of how these conventions are used. Whenever it is time to ship out a box of stuff, we shall use the macro *ensure_dvi_open*.

```
  define log_name ≡ texmf_log_name
  define ensure_dvi_open ≡
          if output_file_name = 0 then
            begin if job_name = 0 then open_log_file;
            pack_job_name(".dvi");
            while ¬b_open_out(dvi_file) do prompt_file_name("file␣name␣for␣output", ".dvi");
            output_file_name ← b_make_name_string(dvi_file);
            end
```

⟨ Global variables 13 ⟩ +≡

```
dvi_file: byte_file;  { the device-independent output goes here }
output_file_name: str_number;  { full name of the output file }
log_name: str_number;  { full name of the log file }
```

534.* The *open_log_file* routine is used to open the transcript file and to help it catch up to what has previously been printed on the terminal.

```
procedure open_log_file;
  var old_setting: 0 .. max_selector; { previous selector setting }
    k: 0 .. buf_size; { index into months and buffer }
    l: 0 .. buf_size; { end of first input line }
    months: const_cstring;
  begin old_setting ← selector;
  if job_name = 0 then job_name ← get_job_name("texput");
  pack_job_name(".fls"); recorder_change_filename(stringcast(name_of_file + 1)); pack_job_name(".log");
  while ¬a_open_out(log_file) do ⟨ Try to get a different log file name 535 ⟩;
  log_name ← a_make_name_string(log_file); selector ← log_only; log_opened ← true;
  ⟨ Print the banner line, including the date and time 536* ⟩;
  if mltex_enabled_p then
    begin wlog_cr; wlog('MLTeX␣v2.2␣enabled');
    end;
  if enctex_enabled_p then
    begin wlog_cr; wlog(encTeX_banner); wlog(',␣reencoding␣enabled');
    if translate_filename then
      begin wlog_cr; wlog('␣(\xordcode,␣\xchrcode,␣\xprncode␣overridden␣by␣TCX)');
      end;
    end;
  input_stack[input_ptr] ← cur_input; { make sure bottom level is in memory }
  print_nl("**"); l ← input_stack[0].limit_field; { last position of first line }
  if buffer[l] = end_line_char then decr(l);
  for k ← 1 to l do print(buffer[k]);
  print_ln; { now the transcript file contains the first line of input }
  selector ← old_setting + 2; { log_only or term_and_log }
  end;
```

536*. ⟨ Print the banner line, including the date and time 536* ⟩ ≡

```
begin if src_specials_p ∨ file_line_error_style_p ∨ parse_first_line_p then wlog(banner_k)
else wlog(banner);
wlog(version_string); slow_print(format_ident); print("␣␣"); print_int(sys_day); print_char("␣");
months ← ´␣JANFEBMARAPRMAYJUNJULAUGSEPOCTNOVDEC´;
for k ← 3 * sys_month − 2 to 3 * sys_month do wlog(months[k]);
print_char("␣"); print_int(sys_year); print_char("␣"); print_two(sys_time div 60); print_char(":");
print_two(sys_time mod 60);
if shellenabledp then
  begin wlog_cr; wlog(´␣´);
  if restrictedshell then
    begin wlog(´restricted␣´);
    end;
  wlog(´\write18␣enabled.´)
  end;
if src_specials_p then
  begin wlog_cr; wlog(´␣Source␣specials␣enabled.´)
  end;
if file_line_error_style_p then
  begin wlog_cr; wlog(´␣file:line:error␣style␣messages␣enabled.´)
  end;
if parse_first_line_p then
  begin wlog_cr; wlog(´␣%&-line␣parsing␣enabled.´);
  end;
if translate_filename then
  begin wlog_cr; wlog(´␣(´); fputs(translate_filename, log_file); wlog(´)´);
  end;
end
```

This code is used in section 534*.

537* Let's turn now to the procedure that is used to initiate file reading when an '`\input`' command is being processed. Beware: For historic reasons, this code foolishly conserves a tiny bit of string pool space; but that can confuse the interactive '`E`' option.

```
procedure start_input; { TEX will \input something }
  label done;
  var temp_str: str_number;
  begin scan_file_name; { set cur_name to desired file name }
  pack_cur_name;
  loop begin begin_file_reading; { set up cur_file and new level of input }
    tex_input_type ← 1; { Tell open_input we are \input. }
      { Kpathsea tries all the various ways to get the file. }
    if kpse_in_name_ok(stringcast(name_of_file + 1)) ∧ a_open_in(cur_file, kpse_tex_format) then
      goto done;
    end_file_reading; { remove the level that didn't work }
    prompt_file_name("input␣file␣name", "");
    end;
done: name ← a_make_name_string(cur_file); source_filename_stack[in_open] ← name;
  full_source_filename_stack[in_open] ← make_full_name_string;
  if name = str_ptr − 1 then { we can try to conserve string pool space now }
    begin temp_str ← search_string(name);
    if temp_str > 0 then
      begin name ← temp_str; flush_string;
      end;
    end;
  if job_name = 0 then
    begin job_name ← get_job_name(cur_name); open_log_file;
    end; { open_log_file doesn't show_context, so limit and loc needn't be set to meaningful values yet }
  if term_offset + length(full_source_filename_stack[in_open]) > max_print_line − 2 then print_ln
  else if (term_offset > 0) ∨ (file_offset > 0) then print_char("␣");
  print_char("("); incr(open_parens); slow_print(full_source_filename_stack[in_open]); update_terminal;
  state ← new_line; ⟨ Read the first line of the new file 538 ⟩;
  end;
```

548.* So that is what TFM files hold. Since TEX has to absorb such information about lots of fonts, it stores most of the data in a large array called *font_info*. Each item of *font_info* is a *memory_word*; the *fix_word* data gets converted into *scaled* entries, while everything else goes into words of type *four_quarters*.

When the user defines \font\f, say, TEX assigns an internal number to the user's font \f. Adding this number to *font_id_base* gives the *eqtb* location of a "frozen" control sequence that will always select the font.

⟨ Types in the outer block 18 ⟩ +≡
internal_font_number = *integer*; { *font* in a *char_node* }
font_index = *integer*; { index into *font_info* }
nine_bits = *min_quarterword* .. *non_char*;

549.* Here now is the (rather formidable) array of font arrays.

define *non_char* ≡ *qi*(256) { a *halfword* code that can't match a real character }
define *non_address* = 0 { a spurious *bchar_label* }

⟨ Global variables 13 ⟩ +≡
font_info: ↑*fmemory_word*; { the big collection of font data }
fmem_ptr: *font_index*; { first unused word of *font_info* }
font_ptr: *internal_font_number*; { largest internal font number in use }
font_check: ↑*four_quarters*; { check sum }
font_size: ↑*scaled*; { "at" size }
font_dsize: ↑*scaled*; { "design" size }
font_params: ↑*font_index*; { how many font parameters are present }
font_name: ↑*str_number*; { name of the font }
font_area: ↑*str_number*; { area of the font }
font_bc: ↑*eight_bits*; { beginning (smallest) character code }
font_ec: ↑*eight_bits*; { ending (largest) character code }
font_glue: ↑*pointer*; { glue specification for interword space, *null* if not allocated }
font_used: ↑*boolean*; { has a character from this font actually appeared in the output? }
hyphen_char: ↑*integer*; { current \hyphenchar values }
skew_char: ↑*integer*; { current \skewchar values }
bchar_label: ↑*font_index*;
{ start of *lig_kern* program for left boundary character, *non_address* if there is none }
font_bchar: ↑*nine_bits*; { boundary character, *non_char* if there is none }
font_false_bchar: ↑*nine_bits*; { *font_bchar* if it doesn't exist in the font, otherwise *non_char* }

550.* Besides the arrays just enumerated, we have directory arrays that make it easy to get at the individual entries in *font_info*. For example, the *char_info* data for character c in font f will be in $font\_info[char\_base[f] + c].qqqq$; and if w is the *width_index* part of this word (the *b0* field), the width of the character is $font\_info[width\_base[f] + w].sc$. (These formulas assume that *min_quarterword* has already been added to c and to w, since TEX stores its quarterwords that way.)

⟨ Global variables 13 ⟩ +≡
char_base: ↑*integer*; { base addresses for *char_info* }
width_base: ↑*integer*; { base addresses for widths }
height_base: ↑*integer*; { base addresses for heights }
depth_base: ↑*integer*; { base addresses for depths }
italic_base: ↑*integer*; { base addresses for italic corrections }
lig_kern_base: ↑*integer*; { base addresses for ligature/kerning programs }
kern_base: ↑*integer*; { base addresses for kerns }
exten_base: ↑*integer*; { base addresses for extensible recipes }
param_base: ↑*integer*; { base addresses for font parameters }

551.* ⟨ Set initial values of key variables 21 ⟩ +≡

552:* TEX always knows at least one font, namely the null font. It has no characters, and its seven parameters are all equal to zero.

⟨ Initialize table entries (done by `INITEX` only) 164 ⟩ +≡

554:* Of course we want to define macros that suppress the detail of how font information is actually packed, so that we don't have to write things like

$$font\_info[width\_base[f] + font\_info[char\_base[f] + c].qqqq.b0].sc$$

too often. The WEB definitions here make $char\_info(f)(c)$ the *four_quarters* word of font information corresponding to character c of font f. If q is such a word, $char\_width(f)(q)$ will be the character's width; hence the long formula above is at least abbreviated to

$$char\_width(f)(char\_info(f)(c)).$$

Usually, of course, we will fetch q first and look at several of its fields at the same time.

The italic correction of a character will be denoted by $char\_italic(f)(q)$, so it is analogous to $char\_width$. But we will get at the height and depth in a slightly different way, since we usually want to compute both height and depth if we want either one. The value of $height\_depth(q)$ will be the 8-bit quantity

$$b = height\_index \times 16 + depth\_index,$$

and if b is such a byte we will write $char\_height(f)(b)$ and $char\_depth(f)(b)$ for the height and depth of the character c for which $q = char\_info(f)(c)$. Got that?

The tag field will be called $char\_tag(q)$; the remainder byte will be called $rem\_byte(q)$, using a macro that we have already defined above.

Access to a character's *width*, *height*, *depth*, and *tag* fields is part of TEX's inner loop, so we want these macros to produce code that is as fast as possible under the circumstances.

MLTEX will assume that a character c exists iff either exists in the current font or a character substitution definition for this character was defined using `\charsubdef`. To avoid the distinction between these two cases, MLTEX introduces the notion "effective character" of an input character c. If c exists in the current font, the effective character of c is the character c itself. If it doesn't exist but a character substitution is defined, the effective character of c is the base character defined in the character substitution. If there is an effective character for a non-existing character c, the "virtual character" c will get appended to the horizontal lists.

The effective character is used within *char_info* to access appropriate character descriptions in the font. For example, when calculating the width of a box, MLTEX will use the metrics of the effective characters. For the case of a substitution, MLTEX uses the metrics of the base character, ignoring the metrics of the accent character.

If character substitutions are changed, it will be possible that a character c neither exists in a font nor there is a valid character substitution for c. To handle these cases *effective_char* should be called with its first argument set to *true* to ensure that it will still return an existing character in the font. If neither c nor the substituted base character in the current character substitution exists, *effective_char* will output a warning and return the character $font\_bc[f]$ (which is incorrect, but can not be changed within the current framework).

Sometimes character substitutions are unwanted, therefore the original definition of *char_info* can be used using the macro *orig_char_info*. Operations in which character substitutions should be avoided are, for example, loading a new font and checking the font metric information in this font, and character accesses in math mode.

560:* TEX checks the information of a TFM file for validity as the file is being read in, so that no further checks will be needed when typesetting is going on. The somewhat tedious subroutine that does this is called *read_font_info*. It has four parameters: the user font identifier u, the file name and area strings *nom* and *aire*, and the "at" size s. If s is negative, it's the negative of a scale factor to be applied to the design size; $s = -1000$ is the normal case. Otherwise s will be substituted for the design size; in this case, s must be positive and less than 2048 pt (i.e., it must be less than 2^{27} when considered as an integer).

The subroutine opens and closes a global file variable called *tfm_file*. It returns the value of the internal font number that was just loaded. If an error is detected, an error message is issued and no font information is stored; *null_font* is returned in this case.

```
define bad_tfm = 11  { label for read_font_info }
define abort ≡ goto bad_tfm  { do this when the TFM data is wrong }
⟨ Declare additional functions for MLTEX 1396* ⟩
function read_font_info(u : pointer; nom, aire : str_number; s : scaled): internal_font_number;
        { input a TFM file }
  label done, bad_tfm, not_found;
  var k: font_index;  { index into font_info }
    name_too_long: boolean;  { nom or aire exceeds 255 bytes? }
    file_opened: boolean;  { was tfm_file successfully opened? }
    lf, lh, bc, ec, nw, nh, nd, ni, nl, nk, ne, np: halfword;  { sizes of subfiles }
    f: internal_font_number;  { the new font's number }

    alpha: integer; beta: 1 .. 16;  { auxiliary quantities used in fixed-point multiplication }
  begin g ← null_font;
  ⟨ Read and check the font data; abort if the TFM file is malformed; if there's no room for this font, say so
      and goto done; otherwise incr(font_ptr) and goto done 562 ⟩;
bad_tfm: ⟨ Report that the font won't be loaded 561* ⟩;
done: if file_opened then b_close(tfm_file);
  read_font_info ← g;
  end;
```

561.* There are programs called `TFtoPL` and `PLtoTF` that convert between the `TFM` format and a symbolic property-list format that can be easily edited. These programs contain extensive diagnostic information, so TEX does not have to bother giving precise details about why it rejects a particular `TFM` file.

```
define start_font_error_message ≡ print_err("Font␣"); sprint_cs(u); print_char("=");
    print_file_name(nom, aire, "");
    if s ≥ 0 then
      begin print("␣at␣"); print_scaled(s); print("pt");
      end
    else if s ≠ −1000 then
        begin print("␣scaled␣"); print_int(−s);
        end
```

⟨ Report that the font won't be loaded 561* ⟩ ≡

```
start_font_error_message;
if file_opened then print("␣not␣loadable:␣Bad␣metric␣(TFM)␣file")
else if name_too_long then print("␣not␣loadable:␣Metric␣(TFM)␣file␣name␣too␣long")
  else print("␣not␣loadable:␣Metric␣(TFM)␣file␣not␣found");
help5("I␣wasn´t␣able␣to␣read␣the␣size␣data␣for␣this␣font,")
("so␣I␣will␣ignore␣the␣font␣specification.")
("[Wizards␣can␣fix␣TFM␣files␣using␣TFtoPL/PLtoTF.]")
("You␣might␣try␣inserting␣a␣different␣font␣spec;")
("e.g.,␣type␣`I\font<same␣font␣id>=<substitute␣font␣name>´."); error
```

This code is used in section 560*.

563.* ⟨ Open *tfm_file* for input 563* ⟩ ≡

```
file_opened ← false; name_too_long ← (length(nom) > 255) ∨ (length(aire) > 255);
if name_too_long then abort;   { kpse_find_file will append the ".tfm", and avoid searching the disk
      before the font alias files as well. }
pack_file_name(nom, aire, "");
if ¬b_open_in(tfm_file) then abort;
file_opened ← true
```

This code is used in section 562.

564.* Note: A malformed `TFM` file might be shorter than it claims to be; thus *eof*(*tfm_file*) might be true when *read_font_info* refers to *tfm_file*↑ or when it says *get*(*tfm_file*). If such circumstances cause system error messages, you will have to defeat them somehow, for example by defining *fget* to be '**begin** *get*(*tfm_file*); **if** *eof*(*tfm_file*) **then** *abort*; **end**'.

```
define fget ≡ tfm_temp ← getc(tfm_file)
define fbyte ≡ tfm_temp
define read_sixteen(#) ≡
      begin # ← fbyte;
      if # > 127 then abort;
      fget; # ← # * ´400 + fbyte;
      end
define store_four_quarters(#) ≡
      begin fget; a ← fbyte; qw.b0 ← qi(a); fget; b ← fbyte; qw.b1 ← qi(b); fget; c ← fbyte;
      qw.b2 ← qi(c); fget; d ← fbyte; qw.b3 ← qi(d); # ← qw;
      end
```

570:* We want to make sure that there is no cycle of characters linked together by *list_tag* entries, since such a cycle would get TEX into an endless loop. If such a cycle exists, the routine here detects it when processing the largest character code in the cycle.

```
define check_byte_range(#) ≡
        begin if (# < bc) ∨ (# > ec) then abort
        end
define current_character_being_worked_on ≡ k + bc − fmem_ptr
```

⟨ Check for charlist cycle 570* ⟩ ≡

```
begin check_byte_range(d);
while d < current_character_being_worked_on do
  begin qw ← orig_char_info(f)(d); { N.B.: not qi(d), since char_base[f] hasn't been adjusted yet }
  if char_tag(qw) ≠ list_tag then goto not_found;
  d ← qo(rem_byte(qw)); { next character on the list }
  end;
if d = current_character_being_worked_on then abort; { yes, there's a cycle }
not_found: end
```

This code is used in section 569.

573:*

```
define check_existence(#) ≡
        begin check_byte_range(#); qw ← orig_char_info(f)(#); { N.B.: not qi(#) }
        if ¬char_exists(qw) then abort;
        end
```

⟨ Read ligature/kern program 573* ⟩ ≡

```
bch_label ← 77777; bchar ← 256;
if nl > 0 then
  begin for k ← lig_kern_base[f] to kern_base[f] + kern_base_offset − 1 do
    begin store_four_quarters(font_info[k].qqqq);
    if a > 128 then
      begin if 256 ∗ c + d ≥ nl then abort;
      if a = 255 then
        if k = lig_kern_base[f] then bchar ← b;
      end
    else begin if b ≠ bchar then check_existence(b);
      if c < 128 then check_existence(d) { check ligature }
      else if 256 ∗ (c − 128) + d ≥ nk then abort; { check kern }
      if a < 128 then
        if k − lig_kern_base[f] + a + 1 ≥ nl then abort;
      end;
    end;
  if a = 255 then bch_label ← 256 ∗ c + d;
  end;
for k ← kern_base[f] + kern_base_offset to exten_base[f] − 1 do store_scaled(font_info[k].sc);
```

This code is used in section 562.

575:* We check to see that the TFM file doesn't end prematurely; but no error message is given for files having more than *lf* words.

```
⟨ Read font parameters 575* ⟩ ≡
  begin for k ← 1 to np do
    if k = 1 then { the slant parameter is a pure number }
      begin fget; sw ← fbyte;
      if sw > 127 then sw ← sw − 256;
      fget; sw ← sw * ´400 + fbyte; fget; sw ← sw * ´400 + fbyte; fget;
      font_info[param_base[f]].sc ← (sw * ´20) + (fbyte div ´20);
      end
    else store_scaled(font_info[param_base[f] + k − 1].sc);
  if feof(tfm_file) then abort;
  for k ← np + 1 to 7 do font_info[param_base[f] + k − 1].sc ← 0;
  end
```

This code is used in section 562.

576:* Now to wrap it up, we have checked all the necessary things about the TFM file, and all we need to do is put the finishing touches on the data for the new font.

```
  define adjust(#) ≡ #[f] ← qo(#[f])  { correct for the excess min_quarterword that was added }
⟨ Make final adjustments and goto done 576* ⟩ ≡
  if np ≥ 7 then font_params[f] ← np else font_params[f] ← 7;
  hyphen_char[f] ← default_hyphen_char; skew_char[f] ← default_skew_char;
  if bch_label < nl then bchar_label[f] ← bch_label + lig_kern_base[f]
  else bchar_label[f] ← non_address;
  font_bchar[f] ← qi(bchar); font_false_bchar[f] ← qi(bchar);
  if bchar ≤ ec then
    if bchar ≥ bc then
      begin qw ← orig_char_info(f)(bchar);  { N.B.: not qi(bchar) }
      if char_exists(qw) then font_false_bchar[f] ← non_char;
      end;
  font_name[f] ← nom; font_area[f] ← aire; font_bc[f] ← bc; font_ec[f] ← ec; font_glue[f] ← null;
  adjust(char_base); adjust(width_base); adjust(lig_kern_base); adjust(kern_base); adjust(exten_base);
  decr(param_base[f]); fmem_ptr ← fmem_ptr + lf; font_ptr ← f; g ← f; goto done
```

This code is used in section 562.

582:* Here is a function that returns a pointer to a character node for a given character in a given font. If that character doesn't exist, *null* is returned instead.

This allows a character node to be used if there is an equivalent in the *char_sub_code* list.

```
function new_character(f : internal_font_number; c : eight_bits): pointer;
  label exit;
  var p: pointer;  { newly allocated node }
    ec: quarterword;  { effective character of c }
  begin ec ← effective_char(false, f, qi(c));
  if font_bc[f] ≤ qo(ec) then
    if font_ec[f] ≥ qo(ec) then
      if char_exists(orig_char_info(f)(ec)) then  { N.B.: not char_info }
        begin p ← get_avail; font(p) ← f; character(p) ← qi(c); new_character ← p; return;
        end;
  char_warning(f, c); new_character ← null;
exit: end;
```

592:* Shipping pages out. After considering TEX's eyes and stomach, we come now to the bowels.

The *ship_out* procedure is given a pointer to a box; its mission is to describe that box in DVI form, outputting a "page" to *dvi_file*. The DVI coordinates $(h, v) = (0, 0)$ should correspond to the upper left corner of the box being shipped.

Since boxes can be inside of boxes inside of boxes, the main work of *ship_out* is done by two mutually recursive routines, *hlist_out* and *vlist_out*, which traverse the hlists and vlists inside of horizontal and vertical boxes.

As individual pages are being processed, we need to accumulate information about the entire set of pages, since such statistics must be reported in the postamble. The global variables *total_pages*, *max_v*, *max_h*, *max_push*, and *last_bop* are used to record this information.

The variable *doing_leaders* is *true* while leaders are being output. The variable *dead_cycles* contains the number of times an output routine has been initiated since the last *ship_out*.

A few additional global variables are also defined here for use in *vlist_out* and *hlist_out*. They could have been local variables, but that would waste stack space when boxes are deeply nested, since the values of these variables are not needed during recursive calls.

```
⟨ Global variables 13 ⟩ +≡
total_pages: integer; { the number of pages that have been shipped out }
max_v: scaled; { maximum height-plus-depth of pages shipped so far }
max_h: scaled; { maximum width of pages shipped so far }
max_push: integer; { deepest nesting of push commands encountered so far }
last_bop: integer; { location of previous bop in the DVI output }
dead_cycles: integer; { recent outputs that didn't ship anything out }
doing_leaders: boolean; { are we inside a leader box? }
  { character and font in current char_node }
c: quarterword;
f: internal_font_number;
rule_ht, rule_dp, rule_wd: scaled; { size of current rule being output }
g: pointer; { current glue specification }
lq, lr: integer; { quantities used in calculations for leaders }
```

595:* Some systems may find it more efficient to make *dvi_buf* a **packed** array, since output of four bytes at once may be facilitated.

```
⟨ Global variables 13 ⟩ +≡
dvi_buf: ↑eight_bits; { buffer for DVI output }
half_buf: integer; { half of dvi_buf_size }
dvi_limit: integer; { end of the current half buffer }
dvi_ptr: integer; { the next available buffer address }
dvi_offset: integer; { dvi_buf_size times the number of times the output buffer has been fully emptied }
dvi_gone: integer; { the number of bytes already output to dvi_file }
```

597:* The actual output of *dvi_buf*$[a \mathinner{..} b]$ to *dvi_file* is performed by calling *write_dvi*(a, b). For best results, this procedure should be optimized to run as fast as possible on each particular system, since it is part of TEX's inner loop. It is safe to assume that a and $b + 1$ will both be multiples of 4 when *write_dvi*(a, b) is called; therefore it is possible on many machines to use efficient methods to pack four bytes per word and to output an array of words with one system call.

In C, we use a macro to call *fwrite* or *write* directly, writing all the bytes in one shot. Much better even than writing four bytes at a time.

598:* To put a byte in the buffer without paying the cost of invoking a procedure each time, we use the macro *dvi_out*.

The length of *dvi_file* should not exceed ″7FFFFFFF; we set *cur_s* ← −2 to prevent further DVI output causing infinite recursion.

```
define dvi_out(#) ≡ begin dvi_buf[dvi_ptr] ← #; incr(dvi_ptr);
    if dvi_ptr = dvi_limit then dvi_swap;
    end
procedure dvi_swap; { outputs half of the buffer }
  begin if dvi_ptr > (″7FFFFFFF − dvi_offset) then
    begin cur_s ← −2; fatal_error("dvi␣length␣exceeds␣""7FFFFFFF");
    end;
  if dvi_limit = dvi_buf_size then
    begin write_dvi(0, half_buf − 1); dvi_limit ← half_buf; dvi_offset ← dvi_offset + dvi_buf_size;
    dvi_ptr ← 0;
    end
  else begin write_dvi(half_buf, dvi_buf_size − 1); dvi_limit ← dvi_buf_size;
    end;
  dvi_gone ← dvi_gone + half_buf;
  end;
```

599:* Here is how we clean out the buffer when TEX is all through; *dvi_ptr* will be a multiple of 4.

```
⟨ Empty the last bytes out of dvi_buf 599* ⟩ ≡
  if dvi_limit = half_buf then write_dvi(half_buf, dvi_buf_size − 1);
  if dvi_ptr > (″7FFFFFFF − dvi_offset) then
    begin cur_s ← −2; fatal_error("dvi␣length␣exceeds␣""7FFFFFFF");
    end;
  if dvi_ptr > 0 then write_dvi(0, dvi_ptr − 1)
```

This code is used in section 642*.

602:* Here's a procedure that outputs a font definition. Since TEX82 uses at most 256 different fonts per job, *fnt_def1* is always used as the command code.

```
procedure dvi_font_def(f : internal_font_number);
  var k: pool_pointer; { index into str_pool }
  begin if f ≤ 256 + font_base then
    begin dvi_out(fnt_def1); dvi_out(f − font_base − 1);
    end
  else begin dvi_out(fnt_def1 + 1); dvi_out((f − font_base − 1) div ´400);
    dvi_out((f − font_base − 1) mod ´400);
    end;
  dvi_out(qo(font_check[f].b0)); dvi_out(qo(font_check[f].b1)); dvi_out(qo(font_check[f].b2));
  dvi_out(qo(font_check[f].b3));
  dvi_four(font_size[f]); dvi_four(font_dsize[f]);
  dvi_out(length(font_area[f])); dvi_out(length(font_name[f]));
  ⟨ Output the font name whose internal number is f 603 ⟩;
  end;
```

617*. ⟨ Initialize variables as *ship_out* begins 617* ⟩ ≡

```
dvi_h ← 0; dvi_v ← 0; cur_h ← h_offset; dvi_f ← null_font; ensure_dvi_open;
if total_pages = 0 then
  begin dvi_out(pre); dvi_out(id_byte); { output the preamble }
  dvi_four(25400000); dvi_four(473628672); { conversion ratio for sp }
  prepare_mag; dvi_four(mag); { magnification factor is frozen }
  if output_comment then
    begin l ← strlen(output_comment); dvi_out(l);
    for s ← 0 to l − 1 do dvi_out(output_comment[s]);
    end
  else begin { the default code is unchanged }
    old_setting ← selector; selector ← new_string; print("␣TeX␣output␣"); print_int(year);
    print_char("."); print_two(month); print_char("."); print_two(day); print_char(":");
    print_two(time div 60); print_two(time mod 60); selector ← old_setting; dvi_out(cur_length);
    for s ← str_start[str_ptr] to pool_ptr − 1 do dvi_out(so(str_pool[s]));
    pool_ptr ← str_start[str_ptr]; { flush the current string }
    end;
  end
```

This code is used in section 640*.

619:* The recursive procedures *hlist_out* and *vlist_out* each have local variables *save_h* and *save_v* to hold the values of *dvi_h* and *dvi_v* just before entering a new level of recursion. In effect, the values of *save_h* and *save_v* on TEX's run-time stack correspond to the values of h and v that a DVI-reading program will push onto its coordinate stack.

```
define move_past = 13 { go to this label when advancing past glue or a rule }
define fin_rule = 14 { go to this label to finish processing a rule }
define next_p = 15 { go to this label when finished with node p }
⟨ Declare procedures needed in hlist_out, vlist_out 1368* ⟩
procedure hlist_out; { output an hlist_node box }
  label reswitch, move_past, fin_rule, next_p, continue, found;
  var base_line: scaled; { the baseline coordinate for this box }
    left_edge: scaled; { the left coordinate for this box }
    save_h, save_v: scaled; { what dvi_h and dvi_v should pop to }
    this_box: pointer; { pointer to containing box }
    g_order: glue_ord; { applicable order of infinity for glue }
    g_sign: normal .. shrinking; { selects type of glue }
    p: pointer; { current position in the hlist }
    save_loc: integer; { DVI byte location upon entry }
    leader_box: pointer; { the leader box being replicated }
    leader_wd: scaled; { width of leader box being replicated }
    lx: scaled; { extra space between leader boxes }
    outer_doing_leaders: boolean; { were we doing leaders? }
    edge: scaled; { left edge of sub-box, or right edge of leader space }
    glue_temp: real; { glue value before rounding }
    cur_glue: real; { glue seen so far }
    cur_g: scaled; { rounded equivalent of cur_glue times the glue ratio }
  begin cur_g ← 0; cur_glue ← float_constant(0); this_box ← temp_ptr; g_order ← glue_order(this_box);
  g_sign ← glue_sign(this_box); p ← list_ptr(this_box); incr(cur_s);
  if cur_s > 0 then dvi_out(push);
  if cur_s > max_push then max_push ← cur_s;
  save_loc ← dvi_offset + dvi_ptr; base_line ← cur_v; left_edge ← cur_h;
  while p ≠ null do ⟨ Output node p for hlist_out and move to the next node, maintaining the condition
      cur_v = base_line 620* ⟩;
  prune_movements(save_loc);
  if cur_s > 0 then dvi_pop(save_loc);
  decr(cur_s);
  end;
```

620.* We ought to give special care to the efficiency of one part of *hlist_out*, since it belongs to TEX's inner loop. When a *char_node* is encountered, we save a little time by processing several nodes in succession until reaching a non-*char_node*. The program uses the fact that *set_char_0* = 0.

In MLTEX this part looks for the existence of a substitution definition for a character *c*, if *c* does not exist in the font, and create appropriate `DVI` commands. Former versions of MLTEX have spliced appropriate character, kern, and box nodes into the horizontal list. Because the user can change character substitutions or `\charsubdefmax` on the fly, we have to test a again for valid substitutions. (Additional it is necessary to be careful—if leaders are used the current hlist is normally traversed more than once!)

```
⟨ Output node p for hlist_out and move to the next node, maintaining the condition cur_v = base_line 620* ⟩ ≡
reswitch: if is_char_node(p) then
    begin synch_h; synch_v;

      end;
    end;
  end
```

This code is used in section 707.

722:* It is convenient to have a procedure that converts a *math_char* field to an "unpacked" form. The *fetch* routine sets *cur_f*, *cur_c*, and *cur_i* to the font code, character code, and character information bytes of a given noad field. It also takes care of issuing error messages for nonexistent characters; in such cases, *char_exists*(*cur_i*) will be *false* after *fetch* has acted, and the field will also have been reset to *empty*.

```
procedure fetch(a : pointer); { unpack the math_char field a }
  begin cur_c ← character(a); cur_f ← fam_fnt(fam(a) + cur_size);
  if cur_f = null_font then ⟨ Complain about an undefined family and set cur_i null 723 ⟩
  else begin if (qo(cur_c) ≥ font_bc[cur_f]) ∧ (qo(cur_c) ≤ font_ec[cur_f]) then
      cur_i ← orig_char_info(cur_f)(cur_c)
    else cur_i ← null_character;
    if ¬(char_exists(cur_i)) then
      begin char_warning(cur_f, qo(cur_c)); math_type(a) ← empty; cur_i ← null_character;
      end;
    end;
  end;
```

740:* ⟨ Switch to a larger accent if available and appropriate 740* ⟩ ≡

```
  loop begin if char_tag(i) ≠ list_tag then goto done;
    y ← rem_byte(i); i ← orig_char_info(f)(y);
    if ¬char_exists(i) then goto done;
    if char_width(f)(i) > w then goto done;
    c ← y;
    end;
done:
```

This code is used in section 738.

749:* If the nucleus of an *op_noad* is a single character, it is to be centered vertically with respect to the axis, after first being enlarged (via a character list in the font) if we are in display style. The normal convention for placing displayed limits is to put them above and below the operator in display style.

The italic correction is removed from the character if there is a subscript and the limits are not being displayed. The *make_op* routine returns the value that should be used as an offset between subscript and superscript.

After *make_op* has acted, *subtype*(q) will be *limits* if and only if the limits have been set above and below the operator. In that case, *new_hlist*(q) will already contain the desired final box.

```
⟨ Declare math construction procedures 734 ⟩ +≡
function make_op(q : pointer): scaled;
  var delta: scaled; { offset between subscript and superscript }

    if (math_type(subscr(q)) ≠ empty) ∧ (subtype(q) ≠ limits) then width(x) ← width(x) − delta;
          { remove italic correction }
    shift_amount(x) ← half(height(x) − depth(x)) − axis_height(cur_size); { center vertically }
    math_type(nucleus(q)) ← sub_box; info(nucleus(q)) ← x;
    end
  else delta ← 0;
  if subtype(q) = limits then ⟨ Construct a box with limits above and below it, skewed by delta 750 ⟩;
  make_op ← delta;
  end;
```

920:* The patterns are stored in a compact table that is also efficient for retrieval, using a variant of "trie memory" [cf. *The Art of Computer Programming* **3** (1973), 481–505]. We can find each pattern $p_1 \dots p_k$ by letting z_0 be one greater than the relevant language index and then, for $1 \le i \le k$, setting $z_i \leftarrow trie\_link(z_{i-1}) + p_i$; the pattern will be identified by the number z_k. Since all the pattern information is packed together into a single *trie_link* array, it is necessary to prevent confusion between the data from inequivalent patterns, so another table is provided such that $trie\_char(z_i) = p_i$ for all i. There is also a table $trie\_op(z_k)$ to identify the numbers $n_0 \dots n_k$ associated with $p_1 \dots p_k$.

The theory that comparatively few different number sequences $n_0 \dots n_k$ actually occur, since most of the n's are generally zero, seems to fail at least for the large German hyphenation patterns. Therefore the number sequences cannot any longer be encoded in such a way that $trie\_op(z_k)$ is only one byte long. We have introduced a new constant *max_trie_op* for the maximum allowable hyphenation operation code value; *max_trie_op* might be different for TEX and INITEX and must not exceed *max_halfword*. An opcode will occupy a halfword if *max_trie_op* exceeds *max_quarterword* or a quarterword otherwise. If $trie\_op(z_k) \neq min\_trie\_op$, when $p_1 \dots p_k$ has matched the letters in $hc[(l-k+1) \,..\, l]$ of language t, we perform all of the required operations for this pattern by carrying out the following little program: Set $v \leftarrow trie\_op(z_k)$. Then set $v \leftarrow v + op\_start[t]$, $hyf[l - hyf\_distance[v]] \leftarrow \max(hyf[l - hyf\_distance[v]], hyf\_num[v])$, and $v \leftarrow hyf\_next[v]$; repeat, if necessary, until $v = min\_trie\_op$.

⟨ Types in the outer block 18 ⟩ +≡
  trie_pointer = 0 .. *ssup_trie_size*; { an index into *trie* }
  trie_opcode = 0 .. *ssup_trie_opcode*; { a trie opcode }

921:* For more than 255 trie op codes, the three fields *trie_link*, *trie_char*, and *trie_op* will no longer fit into one memory word; thus using web2c we define *trie* as three array instead of an array of records. The variant will be implemented by reusing the opcode field later on with another macro.

define *trie_link*(#) ≡ *trie_trl*[#] { "downward" link in a trie }
define *trie_char*(#) ≡ *trie_trc*[#] { character matched at this trie location }
define *trie_op*(#) ≡ *trie_tro*[#] { program for hyphenation at this trie location }

⟨ Global variables 13 ⟩ +≡
  { We will dynamically allocate these arrays. }

hyf_next: **array** [1 .. *trie_op_size*] **of** *trie_opcode*; { continuation code }
op_start: **array** [*ASCII_code*] **of** 0 .. *trie_op_size*; { offset for current language }

923.* Assuming that these auxiliary tables have been set up properly, the hyphenation algorithm is quite short. In the following code we set $hc[hn+2]$ to the impossible value 256, in order to guarantee that $hc[hn+3]$ will never be fetched.

```
⟨ Find hyphen locations for the word in hc, or return 923* ⟩ ≡
  for j ← 0 to hn do hyf[j] ← 0;
  ⟨ Look for the word hc[1 .. hn] in the exception table, and goto found (with hyf containing the hyphens)
      if an entry is found 930* ⟩;
  if trie_char(cur_lang + 1) ≠ qi(cur_lang) then return;  { no patterns for cur_lang }
  hc[0] ← 0; hc[hn + 1] ← 0; hc[hn + 2] ← 256;  { insert delimiters }
  for j ← 0 to hn − r_hyf + 1 do
    begin z ← trie_link(cur_lang + 1) + hc[j]; l ← j;
    while hc[l] = qo(trie_char(z)) do
      begin if trie_op(z) ≠ min_trie_op then ⟨ Store maximum values in the hyf table 924* ⟩;
      incr(l); z ← trie_link(z) + hc[l];
      end;
    end;
found: for j ← 0 to l_hyf − 1 do hyf[j] ← 0;
  for j ← 0 to r_hyf − 1 do hyf[hn − j] ← 0
```

This code is used in section 895.

924.* ⟨ Store maximum values in the *hyf* table 924* ⟩ ≡

```
  begin v ← trie_op(z);
  repeat v ← v + op_start[cur_lang]; i ← l − hyf_distance[v];
    if hyf_num[v] > hyf[i] then hyf[i] ← hyf_num[v];
    v ← hyf_next[v];
  until v = min_trie_op;
  end
```

This code is used in section 923*.

925.* The exception table that is built by TEX's `\hyphenation` primitive is organized as an ordered hash table [cf. Amble and Knuth, *The Computer Journal* **17** (1974), 135–142] using linear probing. If α and β are words, we will say that $\alpha < \beta$ if $|\alpha| < |\beta|$ or if $|\alpha| = |\beta|$ and α is lexicographically smaller than β. (The notation $|\alpha|$ stands for the length of α.) The idea of ordered hashing is to arrange the table so that a given word α can be sought by computing a hash address $h = h(\alpha)$ and then looking in table positions h, $h-1$, ..., until encountering the first word $\leq \alpha$. If this word is different from α, we can conclude that α is not in the table. This is a clever scheme which saves the need for a hash link array. However, it is difficult to increase the size of the hyphen exception arrays. To make this easier, the ordered hash has been replaced by a simple hash, using an additional array *hyph_link*. The value 0 in *hyph_link*$[k]$ means that there are no more entries corresponding to the specific hash chain. When *hyph_link*$[k] > 0$, the next entry in the hash chain is *hyph_link*$[k] - 1$. This value is used because the arrays start at 0.

The words in the table point to lists in *mem* that specify hyphen positions in their *info* fields. The list for $c_1 \ldots c_n$ contains the number k if the word $c_1 \ldots c_n$ has a discretionary hyphen between c_k and c_{k+1}.

```
⟨ Types in the outer block 18 ⟩ +≡
  hyph_pointer = 0 .. ssup_hyph_size;
      { index into hyphen exceptions hash table; enlarging this requires changing (un)dump code }
```

926.* ⟨ Global variables 13 ⟩ +≡
hyph_word: ↑*str_number*; { exception words }
hyph_list: ↑*pointer*; { lists of hyphen positions }
hyph_link: ↑*hyph_pointer*; { link array for hyphen exceptions hash table }
hyph_count: *integer*; { the number of words in the exception dictionary }
hyph_next: *integer*; { next free slot in hyphen exceptions hash table }

928.* ⟨ Set initial values of key variables 21 ⟩ +≡
for $z \leftarrow 0$ **to** *hyph_size* **do**
begin *hyph_word*[*z*] ← 0; *hyph_list*[*z*] ← *null*; *hyph_link*[*z*] ← 0;
end;
hyph_count ← 0; *hyph_next* ← *hyph_prime* + 1;
if *hyph_next* > *hyph_size* **then** *hyph_next* ← *hyph_prime*;

930.* First we compute the hash code h, then we search until we either find the word or we don't. Words from different languages are kept separate by appending the language code to the string.

⟨ Look for the word *hc*[1 .. *hn*] in the exception table, and **goto** *found* (with *hyf* containing the hyphens) if an entry is found 930* ⟩ ≡
$h \leftarrow hc[1]$; *incr*(*hn*); $hc[hn] \leftarrow cur\_lang$;
for $j \leftarrow 2$ **to** *hn* **do** $h \leftarrow (h + h + hc[j])$ **mod** *hyph_prime*;
loop begin ⟨ If the string *hyph_word*[*h*] is less than *hc*[1 .. *hn*], **goto** *not_found*; but if the two strings are equal, set *hyf* to the hyphen positions and **goto** *found* 931* ⟩;
$h \leftarrow hyph\_link[h]$;
if $h = 0$ **then goto** *not_found*;
decr(*h*);
end;
not_found: *decr*(*hn*)
This code is used in section 923*.

931.* ⟨ If the string *hyph_word*[*h*] is less than *hc*[1 .. *hn*], **goto** *not_found*; but if the two strings are equal, set *hyf* to the hyphen positions and **goto** *found* 931* ⟩ ≡
{ This is now a simple hash list, not an ordered one, so the module title is no longer descriptive. }
$k \leftarrow hyph\_word[h]$;
if $k = 0$ **then goto** *not_found*;
if *length*(*k*) = *hn* **then**
begin $j \leftarrow 1$; $u \leftarrow str\_start[k]$;
repeat if $so(str\_pool[u]) \neq hc[j]$ **then goto** *done*;
incr(*j*); *incr*(*u*);
until $j > hn$;
⟨ Insert hyphens as specified in *hyph_list*[*h*] 932 ⟩;
decr(*hn*); **goto** *found*;
end;
done:
This code is used in section 930*.

934* We have now completed the hyphenation routine, so the *line_break* procedure is finished at last. Since the hyphenation exception table is fresh in our minds, it's a good time to deal with the routine that adds new entries to it.

When TEX has scanned '`\hyphenation`', it calls on a procedure named *new_hyph_exceptions* to do the right thing.

```
define set_cur_lang ≡
    if language ≤ 0 then cur_lang ← 0
    else if language > 255 then cur_lang ← 0
      else cur_lang ← language
procedure new_hyph_exceptions; { enters new exceptions }
  label reswitch, exit, found, not_found;
  var n: 0 .. 64; { length of current word; not always a small_number }
    j: 0 .. 64; { an index into hc }
    h: hyph_pointer; { an index into hyph_word and hyph_list }
    k: str_number; { an index into str_start }
    p: pointer; { head of a list of hyphen positions }
    q: pointer; { used when creating a new node for list p }
    s: str_number; { strings being compared or stored }
    u, v: pool_pointer; { indices into str_pool }
  begin scan_left_brace; { a left brace must follow \hyphenation }
  set_cur_lang;
  ⟨ Enter as many hyphenation exceptions as are listed, until coming to a right brace; then return 935 ⟩;
exit: end;
```

939* ⟨ Enter a hyphenation exception 939* ⟩ ≡

```
begin incr(n); hc[n] ← cur_lang; str_room(n); h ← 0;
for j ← 1 to n do
  begin h ← (h + h + hc[j]) mod hyph_prime; append_char(hc[j]);
  end;
s ← make_string; ⟨ Insert the pair (s, p) into the exception table 940* ⟩;
end
```

This code is used in section 935.

940* ⟨ Insert the pair (s, p) into the exception table 940* ⟩ ≡

```
if hyph_next ≤ hyph_prime then
  while (hyph_next > 0) ∧ (hyph_word[hyph_next − 1] > 0) do decr(hyph_next);
if (hyph_count = hyph_size) ∨ (hyph_next = 0) then overflow("exception␣dictionary", hyph_size);
incr(hyph_count);
while hyph_word[h] ≠ 0 do
  begin ⟨ If the string hyph_word[h] is less than or equal to s, interchange (hyph_word[h], hyph_list[h])
      with (s, p) 941* ⟩;
  if hyph_link[h] = 0 then
    begin hyph_link[h] ← hyph_next;
    if hyph_next ≥ hyph_size then hyph_next ← hyph_prime;
    if hyph_next > hyph_prime then incr(hyph_next);
    end;
  h ← hyph_link[h] − 1;
  end;
found: hyph_word[h] ← s; hyph_list[h] ← p
```

This code is used in section 939*.

941:* ⟨ If the string *hyph_word*[*h*] is less than or equal to *s*, interchange (*hyph_word*[*h*], *hyph_list*[*h*]) with (*s*, *p*) 941* ⟩ ≡

decr(*hyph_count*); { We could also *flush_list*(*hyph_list*[*h*]);, but it interferes with `trip.log`. }
goto *found*;
not_found:

This code is used in section 940*.

943:* Before we discuss trie building in detail, let's consider the simpler problem of creating the *hyf_distance*, *hyf_num*, and *hyf_next* arrays.

Suppose, for example, that TEX reads the pattern '`ab2cde1`'. This is a pattern of length 5, with $n_0 \ldots n_5 = 0\,0\,2\,0\,0\,1$ in the notation above. We want the corresponding *trie_op* code v to have $hyf\_distance[v] = 3$, $hyf\_num[v] = 2$, and $hyf\_next[v] = v'$, where the auxiliary *trie_op* code v' has $hyf\_distance[v'] = 0$, $hyf\_num[v'] = 1$, and $hyf\_next[v'] = min\_trie\_op$.

TEX computes an appropriate value v with the *new_trie_op* subroutine below, by setting

$$v' \leftarrow new\_trie\_op(0, 1, min\_trie\_op), \qquad v \leftarrow new\_trie\_op(3, 2, v').$$

This subroutine looks up its three parameters in a special hash table, assigning a new value only if these three have not appeared before for the current language.

The hash table is called *trie_op_hash*, and the number of entries it contains is *trie_op_ptr*.

```
⟨ Global variables 13 ⟩ +≡
  init trie_op_hash: array [neg_trie_op_size .. trie_op_size] of 0 .. trie_op_size;
      { trie op codes for quadruples }
trie_used: array [ASCII_code] of trie_opcode; { largest opcode used so far for this language }
trie_op_lang: array [1 .. trie_op_size] of ASCII_code; { language part of a hashed quadruple }
trie_op_val: array [1 .. trie_op_size] of trie_opcode; { opcode corresponding to a hashed quadruple }
trie_op_ptr: 0 .. trie_op_size; { number of stored ops so far }
  tini
max_op_used: trie_opcode; { largest opcode used for any language }
small_op: boolean; { flag used while dumping or undumping }
```

944:* It's tempting to remove the *overflow* stops in the following procedure; *new_trie_op* could return *min_trie_op* (thereby simply ignoring part of a hyphenation pattern) instead of aborting the job. However, that would lead to different hyphenation results on different installations of TEX using the same patterns. The *overflow* stops are necessary for portability of patterns.

```
⟨ Declare procedures for preprocessing hyphenation patterns 944* ⟩ ≡
function new_trie_op(d, n : small_number; v : trie_opcode): trie_opcode;
  label exit;
  var h: neg_trie_op_size .. trie_op_size;  { trial hash location }

This code is used in section 942.

945:* After *new_trie_op* has compressed the necessary opcode information, plenty of information is available to unscramble the data into the final form needed by our hyphenation algorithm.

```
⟨ Sort the hyphenation op tables into proper order 945* ⟩ ≡
  op_start[0] ← −min_trie_op;
  for j ← 1 to 255 do op_start[j] ← op_start[j − 1] + qo(trie_used[j − 1]);
  for j ← 1 to trie_op_ptr do trie_op_hash[j] ← op_start[trie_op_lang[j]] + trie_op_val[j];  { destination }
  for j ← 1 to trie_op_ptr do
    while trie_op_hash[j] > j do
      begin k ← trie_op_hash[j];
      t ← hyf_distance[k]; hyf_distance[k] ← hyf_distance[j]; hyf_distance[j] ← t;
      t ← hyf_num[k]; hyf_num[k] ← hyf_num[j]; hyf_num[j] ← t;
      t ← hyf_next[k]; hyf_next[k] ← hyf_next[j]; hyf_next[j] ← t;
      trie_op_hash[j] ← trie_op_hash[k]; trie_op_hash[k] ← k;
      end
```

This code is used in section 952.

946:* Before we forget how to initialize the data structures that have been mentioned so far, let's write down the code that gets them started.

```
⟨ Initialize table entries (done by INITEX only) 164 ⟩ +≡
  for k ← −trie_op_size to trie_op_size do trie_op_hash[k] ← 0;
  for k ← 0 to 255 do trie_used[k] ← min_trie_op;
  max_op_used ← min_trie_op; trie_op_ptr ← 0;
```

947:* The linked trie that is used to preprocess hyphenation patterns appears in several global arrays. Each node represents an instruction of the form "if you see character c, then perform operation o, move to the next character, and go to node l; otherwise go to node r." The four quantities c, o, l, and r are stored in four arrays *trie_c*, *trie_o*, *trie_l*, and *trie_r*. The root of the trie is *trie_l*[0], and the number of nodes is *trie_ptr*. Null trie pointers are represented by zero. To initialize the trie, we simply set *trie_l*[0] and *trie_ptr* to zero. We also set *trie_c*[0] to some arbitrary value, since the algorithm may access it.

The algorithms maintain the condition

$$trie\_c[trie\_r[z]] > trie\_c[z] \qquad \text{whenever } z \neq 0 \text{ and } trie\_r[z] \neq 0;$$

in other words, sibling nodes are ordered by their c fields.

```
  define trie_root ≡ trie_l[0]  { root of the linked trie }
⟨ Global variables 13 ⟩ +≡
  init trie_c: ↑packed_ASCII_code;  { characters to match }
  trie_o: ↑trie_opcode;  { operations to perform }
  trie_l: ↑trie_pointer;  { left subtrie links }
  trie_r: ↑trie_pointer;  { right subtrie links }
  trie_ptr: trie_pointer;  { the number of nodes in the trie }
  trie_hash: ↑trie_pointer;  { used to identify equivalent subtries }
  tini
```

950:* The compressed trie will be packed into the *trie* array using a "top-down first-fit" procedure. This is a little tricky, so the reader should pay close attention: The *trie_hash* array is cleared to zero again and renamed *trie_ref* for this phase of the operation; later on, *trie_ref*[p] will be nonzero only if the linked trie node p is the smallest character in a family and if the characters c of that family have been allocated to locations *trie_ref*[p] + c in the *trie* array. Locations of *trie* that are in use will have *trie_link* = 0, while the unused holes in *trie* will be doubly linked with *trie_link* pointing to the next larger vacant location and *trie_back* pointing to the next smaller one. This double linking will have been carried out only as far as *trie_max*, where *trie_max* is the largest index of *trie* that will be needed. To save time at the low end of the trie, we maintain array entries *trie_min*[c] pointing to the smallest hole that is greater than c. Another array *trie_taken* tells whether or not a given location is equal to *trie_ref*[p] for some p; this array is used to ensure that distinct nodes in the compressed trie will have distinct *trie_ref* entries.

```
  define trie_ref ≡ trie_hash  { where linked trie families go into trie }
  define trie_back(#) ≡ trie_tro[#]  { use the opcode field now for backward links }
⟨ Global variables 13 ⟩ +≡
  init trie_taken: ↑boolean;  { does a family start here? }
  trie_min: array [ASCII_code] of trie_pointer;  { the first possible slot for each character }
  trie_max: trie_pointer;  { largest location used in trie }
  trie_not_ready: boolean;  { is the trie still in linked form? }
  tini
```

951:* Each time `\patterns` appears, it contributes further patterns to the future trie, which will be built only when hyphenation is attempted or when a format file is dumped. The boolean variable *trie_not_ready* will change to *false* when the trie is compressed; this will disable further patterns.

```
⟨ Initialize table entries (done by INITEX only) 164 ⟩ +≡
  trie_not_ready ← true;
```

958:* When the whole trie has been allocated into the sequential table, we must go through it once again so that *trie* contains the correct information. Null pointers in the linked trie will be represented by the value 0, which properly implements an "empty" family.

```
  define clear_trie ≡ { clear trie[r] }
        begin trie_link(r) ← 0; trie_op(r) ← min_trie_op; trie_char(r) ← min_quarterword;
            { trie_char ← qi(0) }
        end
⟨ Move the data into trie 958* ⟩ ≡
  if trie_root = 0 then { no patterns were given }
    begin for r ← 0 to 256 do clear_trie;
    trie_max ← 256;
    end
  else begin trie_fix(trie_root); { this fixes the non-holes in trie }
    r ← 0; { now we will zero out all the holes }
    repeat s ← trie_link(r); clear_trie; r ← s;
    until r > trie_max;
    end;
  trie_char(0) ← qi("?"); { make trie_char(c) ≠ c for all c }
```

This code is used in section 966*.

960:* Now let's go back to the easier problem, of building the linked trie. When `INITEX` has scanned the '`\patterns`' control sequence, it calls on *new_patterns* to do the right thing.

```
⟨ Declare procedures for preprocessing hyphenation patterns 944* ⟩ +≡
procedure new_patterns; { initializes the hyphenation pattern data }
  label done, done1;
  var k, l: 0 .. 64; { indices into hc and hyf; not always in small_number range }
    digit_sensed: boolean; { should the next digit be treated as a letter? }
    v: trie_opcode; { trie op code }
    p, q: trie_pointer; { nodes of trie traversed during insertion }
    first_child: boolean; { is p = trie_l[q]? }
    c: ASCII_code; { character being inserted }
  begin if trie_not_ready then
    begin set_cur_lang; scan_left_brace; { a left brace must follow \patterns }
    ⟨ Enter all of the patterns into a linked trie, until coming to a right brace 961 ⟩;
    end
  else begin print_err("Too late for "); print_esc("patterns");
    help1("All patterns must be given before typesetting begins."); error;
    link(garbage) ← scan_toks(false, false); flush_list(def_ref);
    end;
  end;
```

963:* When the following code comes into play, the pattern $p_1 \ldots p_k$ appears in $hc[1 \,..\, k]$, and the corresponding sequence of numbers $n_0 \ldots n_k$ appears in $hyf[0 \,..\, k]$.

```
⟨ Insert a new pattern into the linked trie 963* ⟩ ≡
  begin ⟨ Compute the trie op code, v, and set l ← 0 965* ⟩;
  q ← 0; hc[0] ← cur_lang;
  while l ≤ k do
    begin c ← hc[l]; incr(l); p ← trie_l[q]; first_child ← true;
    while (p > 0) ∧ (c > so(trie_c[p])) do
      begin q ← p; p ← trie_r[q]; first_child ← false;
      end;
    if (p = 0) ∨ (c < so(trie_c[p])) then
      ⟨ Insert a new trie node between q and p, and make p point to it 964* ⟩;
    q ← p;  { now node q represents p_1 ... p_{l-1} }
    end;
  if trie_o[q] ≠ min_trie_op then
    begin print_err("Duplicate␣pattern"); help1("(See␣Appendix␣H.)"); error;
    end;
  trie_o[q] ← v;
  end
```

This code is used in section 961.

964:* ⟨ Insert a new trie node between q and p, and make p point to it 964* ⟩ ≡

```
  begin if trie_ptr = trie_size then overflow("pattern␣memory", trie_size);
  incr(trie_ptr); trie_r[trie_ptr] ← p; p ← trie_ptr; trie_l[p] ← 0;
  if first_child then trie_l[q] ← p else trie_r[q] ← p;
  trie_c[p] ← si(c); trie_o[p] ← min_trie_op;
  end
```

This code is used in section 963*.

965:* ⟨ Compute the trie op code, v, and set $l \leftarrow 0$ 965* ⟩ ≡

```
  if hc[1] = 0 then hyf[0] ← 0;
  if hc[k] = 0 then hyf[k] ← 0;
  l ← k; v ← min_trie_op;
  loop begin if hyf[l] ≠ 0 then v ← new_trie_op(k − l, hyf[l], v);
    if l > 0 then decr(l) else goto done1;
    end;
done1:
```

This code is used in section 963*.

966:* Finally we put everything together: Here is how the trie gets to its final, efficient form. The following packing routine is rigged so that the root of the linked tree gets mapped into location 1 of *trie*, as required by the hyphenation algorithm. This happens because the first call of *first_fit* will "take" location 1.

```
⟨ Declare procedures for preprocessing hyphenation patterns 944* ⟩ +≡
procedure init_trie;
  var p: trie_pointer;  { pointer for initialization }
    j, k, t: integer;  { all-purpose registers for initialization }
    r, s: trie_pointer;  { used to clean up the packed trie }
  begin ⟨ Get ready to compress the trie 952 ⟩;
  if trie_root ≠ 0 then
    begin first_fit(trie_root); trie_pack(trie_root);
    end;
  ⟨ Move the data into trie 958* ⟩;
  trie_not_ready ← false;
  end;
```

1034* We leave the *space_factor* unchanged if $sf\_code(cur\_chr) = 0$; otherwise we set it equal to $sf\_code(cur\_chr)$, except that it should never change from a value less than 1000 to a value exceeding 1000. The most common case is $sf\_code(cur\_chr) = 1000$, so we want that case to be fast.

The overall structure of the main loop is presented here. Some program labels are inside the individual sections.

```
define adjust_space_factor ≡
    main_s ← sf_code(cur_chr);
    if main_s = 1000 then space_factor ← 1000
    else if main_s < 1000 then
        begin if main_s > 0 then space_factor ← main_s;
        end
      else if space_factor < 1000 then space_factor ← 1000
        else space_factor ← main_s
```

⟨ Append character *cur_chr* and the following characters (if any) to the current hlist in the current font; **goto** *reswitch* when a non-character has been fetched 1034* ⟩ ≡

```
if ((head = tail) ∧ (mode > 0)) then
  begin if (insert_src_special_auto) then append_src_special;
  end;
adjust_space_factor;
main_f ← cur_font; bchar ← font_bchar[main_f]; false_bchar ← font_false_bchar[main_f];
if mode > 0 then
  if language ≠ clang then fix_language;

⟨ Close the format file 1329 ⟩;
end;
tini
```

1303.* Corresponding to the procedure that dumps a format file, we have a function that reads one in. The function returns *false* if the dumped format is incompatible with the present TEX table sizes, etc.
```
define bad_fmt = 6666 { go here if the format file is unacceptable }
define too_small(#) ≡
        begin wake_up_terminal; wterm_ln('---!␣Must␣increase␣the␣', #); goto bad_fmt;
        end
```
⟨ Declare the function called open_fmt_file 524* ⟩
```
function load_fmt_file: boolean;
label bad_fmt, exit;
var j, k: integer; { all-purpose indices }
  p, q: pointer; { all-purpose pointers }
  x: integer; { something undumped }
  format_engine: ↑text_char; dummy_xord: ASCII_code; dummy_xchr: text_char;
  dummy_xprn: ASCII_code;
begin ⟨ Undump constants for consistency check 1308* ⟩;
⟨ Undump MLTEX-specific data 1404* ⟩;
⟨ Undump encTEX-specific data 1413* ⟩;
⟨ Undump the string pool 1310* ⟩;
⟨ Undump the dynamic memory 1312* ⟩;
⟨ Undump the table of equivalents 1314* ⟩;
⟨ Undump the font information 1321* ⟩;
⟨ Undump the hyphenation tables 1325* ⟩;
⟨ Undump a couple more things and the closing check word 1327* ⟩;
load_fmt_file ← true; return; { it worked! }
bad_fmt: wake_up_terminal; wterm_ln('(Fatal␣format␣file␣error;␣I''m␣stymied)');
  load_fmt_file ← false;
exit: end;
```

1305* Format files consist of *memory_word* items, and we use the following macros to dump words of different types:

```
⟨ Global variables 13 ⟩ +≡
fmt_file: word_file; { for input or output of format information }
```

1306* The inverse macros are slightly more complicated, since we need to check the range of the values we are reading in. We say '*undump*$(a)(b)(x)$' to read an integer value x that is supposed to be in the range $a \le x \le b$. System error messages should be suppressed when undumping.

```
define undump_end_end(#) ≡ # ← x; end
define undump_end(#) ≡ (x > #) then goto bad_fmt else undump_end_end
define undump(#) ≡
    begin undump_int(x);
    if (x < #) ∨ undump_end
define format_debug_end(#) ≡ write_ln(stderr, ´␣=␣´, #);
    end ;
define format_debug(#) ≡
    if debug_format_file then
      begin write(stderr, ´fmtdebug:´, #); format_debug_end
define undump_size_end_end(#) ≡ too_small(#) else format_debug(#)(x); undump_end_end
define undump_size_end(#) ≡
      if x > # then undump_size_end_end
define undump_size(#) ≡
    begin undump_int(x);
    if x < # then goto bad_fmt;
    undump_size_end
```

1307* The next few sections of the program should make it clear how we use the dump/undump macros.

```
⟨ Dump constants for consistency check 1307* ⟩ ≡
  dump_int(″57325458); { Web2C TEX's magic constant: "W2TX" }
    { Align engine to 4 bytes with one or more trailing NUL }

⟨ Undump the hash table 1319* ⟩
```

This code is used in section 1303*.

1315.* The table of equivalents usually contains repeated information, so we dump it in compressed form: The sequence of $n+2$ values $(n, x_1, \ldots, x_n, m)$ in the format file represents $n+m$ consecutive entries of *eqtb*, with m extra copies of x_n, namely $(x_1, \ldots, x_n, x_n, \ldots, x_n)$.

⟨ Dump regions 1 to 4 of *eqtb* 1315* ⟩ ≡

```
k ← active_base;
repeat j ← k;
  while j < int_base − 1 do
    begin if (equiv(j) = equiv(j + 1)) ∧ (eq_type(j) = eq_type(j + 1)) ∧ (eq_level(j) = eq_level(j + 1))
        then goto found1;
    incr(j);
    end;
  l ← int_base; goto done1; { j = int_base − 1 }
found1: incr(j); l ← j;
  while j < int_base − 1 do
    begin if (equiv(j) ≠ equiv(j + 1)) ∨ (eq_type(j) ≠ eq_type(j + 1)) ∨ (eq_level(j) ≠ eq_level(j + 1))
        then goto done1;
    incr(j);
    end;
done1: dump_int(l − k); dump_things(eqtb[k], l − k); k ← j + 1; dump_int(k − l);
until k = int_base
```

This code is used in section 1313.

1316* ⟨ Dump regions 5 and 6 of *eqtb* 1316* ⟩ ≡

```
repeat j ← k;
  while j < eqtb_size do
    begin if eqtb[j].int = eqtb[j + 1].int then goto found2;
    incr(j);
    end;

1333* Here we do whatever is needed to complete TEX's job gracefully on the local operating system. The code here might come into play after a fatal error; it must therefore consist entirely of "safe" operations that cannot produce error messages. For example, it would be a mistake to call *str_room* or *make_string* at this time, because a call on *overflow* might lead to an infinite loop. (Actually there's one way to get error messages, via *prepare_mag*; but that can't cause infinite recursion.)

If *final_cleanup* is bypassed, this program doesn't bother to close the input files that may still be open.

```
⟨ Last-minute procedures 1333* ⟩ ≡
procedure close_files_and_terminate;
  var k: integer;  { all-purpose index }
  begin ⟨ Finish the extensions 1378 ⟩;

This code is used in section 1332*.

1338* Debugging. Once TEX is working, you should be able to diagnose most errors with the `\show` commands and other diagnostic features. But for the initial stages of debugging, and for the revelation of really deep mysteries, you can compile TEX with a few more aids, including the Pascal runtime checks and its debugger. An additional routine called *debug_help* will also come into play when you type '`D`' after an error message; *debug_help* also occurs just before a fatal error causes TEX to succumb.

The interface to *debug_help* is primitive, but it is good enough when used with a Pascal debugger that allows you to set breakpoints and to read variables and change their values. After getting the prompt '`debug #`', you type either a negative number (this exits *debug_help*), or zero (this goes to a location where you can set a breakpoint, thereby entering into dialog with the Pascal debugger), or a positive number m followed by an argument n. The meaning of m and n will be clear from the program below. (If $m = 13$, there is an additional argument, l.)

```
  define breakpoint = 888  { place where a breakpoint is desirable }
⟨ Last-minute procedures 1333* ⟩ +≡
  debug procedure debug_help;  { routine to display various things }
  label breakpoint, exit;
  var k, l, m, n: integer;
  begin clear_terminal;
  loop
    begin wake_up_terminal; print_nl("debug␣#␣(-1␣to␣exit):"); update_terminal; read(term_in, m);
    if m < 0 then return
    else if m = 0 then dump_core  { do something to cause a core dump }
      else begin read(term_in, n);
        case m of
        ⟨ Numbered cases for debug_help 1339* ⟩
        othercases print("?")
        endcases;
        end;
    end;

This code is used in section 1338*.

1341:* First let's consider the format of whatsit nodes that are used to represent the data associated with `\write` and its relatives. Recall that a whatsit has *type* = *whatsit_node*, and the *subtype* is supposed to distinguish different kinds of whatsits. Each node occupies two or more words; the exact number is immaterial, as long as it is readily determined from the *subtype* or other data.

We shall introduce five *subtype* values here, corresponding to the control sequences `\openout`, `\write`, `\closeout`, `\special`, and `\setlanguage`. The second word of I/O whatsits has a *write_stream* field that identifies the write-stream number (0 to 15, or 16 for out-of-range and positive, or 17 for out-of-range and negative). In the case of `\write` and `\special`, there is also a field that points to the reference count of a token list that should be sent. In the case of `\openout`, we need three words and three auxiliary subfields to hold the string numbers for name, area, and extension.

define *write_node_size* = 2 { number of words in a write/whatsit node }
define *open_node_size* = 3 { number of words in an open/whatsit node }
define *open_node* = 0 { *subtype* in whatsits that represent files to `\openout` }
define *write_node* = 1 { *subtype* in whatsits that represent things to `\write` }
define *close_node* = 2 { *subtype* in whatsits that represent streams to `\closeout` }
define *special_node* = 3 { *subtype* in whatsits that represent `\special` things }
define *language_node* = 4 { *subtype* in whatsits that change the current language }
define *what_lang*(#) ≡ *link*(# + 1) { language number, in the range 0 .. 255 }
define *what_lhm*(#) ≡ *type*(# + 1) { minimum left fragment, in the range 1 .. 63 }
define *what_rhm*(#) ≡ *subtype*(# + 1) { minimum right fragment, in the range 1 .. 63 }
define *write_tokens*(#) ≡ *link*(# + 1) { reference count of token list to write }
define *write_stream*(#) ≡ *type*(# + 1) { stream number (0 to 17) }
define *mubyte_zero* ≡ 64
define *write_mubyte*(#) ≡ *subtype*(# + 1) { mubyte value + *mubyte_zero* }
define *open_name*(#) ≡ *link*(# + 1) { string number of file name to open }
define *open_area*(#) ≡ *info*(# + 2) { string number of file area for *open_name* }
define *open_ext*(#) ≡ *link*(# + 2) { string number of file extension for *open_name* }

1344:* Extensions might introduce new command codes; but it's best to use *extension* with a modifier, whenever possible, so that *main_control* stays the same.

define *immediate_code* = 4 { command modifier for `\immediate` }
define *set_language_code* = 5 { command modifier for `\setlanguage` }

  end

This code is used in section 1348*.

1355.* Each new type of node that appears in our data structure must be capable of being displayed, copied, destroyed, and so on. The routines that we need for write-oriented whatsits are somewhat like those for mark nodes; other extensions might, of course, involve more subtlety here.

```
⟨ Basic printing procedures 57 ⟩ +≡
procedure print_write_whatsit(s : str_number; p : pointer);
  begin print_esc(s);
  if write_stream(p) < 16 then print_int(write_stream(p))
  else if write_stream(p) = 16 then print_char("*")
    else print_char("-");
  if (s = "write") ∧ (write_mubyte(p) ≠ mubyte_zero) then
    begin print_char("<"); print_int(write_mubyte(p) − mubyte_zero); print_char(">");
    end;
  end;
```

1356.* ⟨ Display the whatsit node p 1356* ⟩ ≡

```
  case subtype(p) of
  open_node: begin print_write_whatsit("openout", p); print_char("=");
    print_file_name(open_name(p), open_area(p), open_ext(p));
    end;
  write_node: begin print_write_whatsit("write", p); print_mark(write_tokens(p));
    end;
  close_node: print_write_whatsit("closeout", p);
  special_node: begin print_esc("special");
    if write_stream(p) ≠ mubyte_zero then
      begin print_char("<"); print_int(write_stream(p) − mubyte_zero);
      if (write_stream(p) − mubyte_zero = 2) ∨ (write_stream(p) − mubyte_zero = 3) then
        begin print_char(":"); print_int(write_mubyte(p) − mubyte_zero);
        end;
      print_char(">");
      end;
    print_mark(write_tokens(p));
    end;
  language_node: begin print_esc("setlanguage"); print_int(what_lang(p)); print("␣(hyphenmin␣");
    print_int(what_lhm(p)); print_char(","); print_int(what_rhm(p)); print_char(")");
    end;
  othercases print("whatsit?")
  endcases
```

This code is used in section 183.

1368*. After all this preliminary shuffling, we come finally to the routines that actually send out the requested data. Let's do `\special` first (it's easier).

```
⟨ Declare procedures needed in hlist_out, vlist_out 1368* ⟩ ≡
procedure special_out(p : pointer);
  var old_setting: 0 .. max_selector; { holds print selector }
    k: pool_pointer; { index into str_pool }

            end;
          end;
      end;
    end
```

This code is used in section 1373*.

1379* System-dependent changes for Web2c. Here are extra variables for Web2c. (This numbering of the system-dependent section allows easy integration of Web2c and e-TEX, etc.)

```
⟨ Global variables 13 ⟩ +≡
edit_name_start: pool_pointer; { where the filename to switch to starts }
edit_name_length, edit_line: integer; { what line to start editing at }
ipc_on: cinttype; { level of IPC action, 0 for none [default] }
stop_at_space: boolean; { whether more_name returns false for space }
```

1380* The *edit_name_start* will be set to point into *str_pool* somewhere after its beginning if TEX is supposed to switch to an editor on exit.

```
⟨ Set initial values of key variables 21 ⟩ +≡
  edit_name_start ← 0; stop_at_space ← true;
```

1381* These are used when we regenerate the representation of the first 256 strings.

```
⟨ Global variables 13 ⟩ +≡
save_str_ptr: str_number;
save_pool_ptr: pool_pointer;
shellenabledp: cinttype;
restrictedshell: cinttype;
output_comment: ↑char;
k, l: 0 .. 255; { used by 'Make the first 256 strings', etc. }
```

1382* When debugging a macro package, it can be useful to see the exact control sequence names in the format file. For example, if ten new csnames appear, it's nice to know what they are, to help pinpoint where they came from. (This isn't a truly "basic" printing procedure, but that's a convenient module in which to put it.)

```
⟨ Basic printing procedures 57 ⟩ +≡
procedure print_csnames(hstart : integer; hfinish : integer);
  var c, h: integer;
  begin write_ln(stderr, 'fmtdebug:csnames␣from␣', hstart, '␣to␣', hfinish, ':');
  for h ← hstart to hfinish do
    begin if text(h) > 0 then
      begin { if have anything at this position }
      for c ← str_start[text(h)] to str_start[text(h) + 1] − 1 do
        begin put_byte(str_pool[c], stderr); { print the characters }
        end;
      write_ln(stderr, '|');
      end;
    end;
  end;
```

1383* Are we printing extra info as we read the format file?

```
⟨ Global variables 13 ⟩ +≡
debug_format_file: boolean;
```

1384:* A helper for printing file:line:error style messages. Look for a filename in *full_source_filename_stack*, and if we fail to find one fall back on the non-file:line:error style.

```
⟨ Basic printing procedures 57 ⟩ +≡
procedure print_file_line;
  var level: 0 .. max_in_open;
  begin level ← in_open;
  while (level > 0) ∧ (full_source_filename_stack[level] = 0) do decr(level);
  if level = 0 then print_nl("!␣")
  else begin print_nl(""); print(full_source_filename_stack[level]); print(":");
    if level = in_open then print_int(line)
    else print_int(line_stack[level + 1]);
    print(":␣");
    end;
  end;
```

1385:* To be able to determine whether `\write18` is enabled from within TEX we also implement `\eof18`. We sort of cheat by having an additional route *scan_four_bit_int_or_18* which is the same as *scan_four_bit_int* except it also accepts the value 18.

```
⟨ Declare procedures that scan restricted classes of integers 433 ⟩ +≡
procedure scan_four_bit_int_or_18;
  begin scan_int;
  if (cur_val < 0) ∨ ((cur_val > 15) ∧ (cur_val ≠ 18)) then
    begin print_err("Bad␣number");
    help2("Since␣I␣expected␣to␣read␣a␣number␣between␣0␣and␣15,")
    ("I␣changed␣this␣one␣to␣zero."); int_error(cur_val); cur_val ← 0;
    end;
  end;
```

1386:* Dumping the *xord*, *xchr*, and *xprn* arrays. We dump these always in the format, so a TCX file loaded during format creation can set a default for users of the format.

```
⟨ Dump xord, xchr, and xprn 1386* ⟩ ≡
  dump_things(xord[0], 256); dump_things(xchr[0], 256); dump_things(xprn[0], 256);
```

This code is used in section 1307*.

1387:* Undumping the *xord*, *xchr*, and *xprn* arrays. This code is more complicated, because we want to ensure that a TCX file specified on the command line will override whatever is in the format. Since the tcx file has already been loaded, that implies throwing away the data in the format. Also, if no *translate_filename* is given, but *eight_bit_p* is set we have to make all characters printable.

```
⟨ Undump xord, xchr, and xprn 1387* ⟩ ≡
  if translate_filename then
    begin for k ← 0 to 255 do undump_things(dummy_xord, 1);
    for k ← 0 to 255 do undump_things(dummy_xchr, 1);
    for k ← 0 to 255 do undump_things(dummy_xprn, 1);
    end
  else begin undump_things(xord[0], 256); undump_things(xchr[0], 256); undump_things(xprn[0], 256);
    if eight_bit_p then
      for k ← 0 to 255 do xprn[k] ← 1;
    end;
```

This code is used in section 1308*.

1388* The string recycling routines. TEX uses 2 upto 4 *new* strings when scanning a filename in an `\input`, `\openin`, or `\openout` operation. These strings are normally lost because the reference to them are not saved after finishing the operation. *search_string* searches through the string pool for the given string and returns either 0 or the found string number.

```
⟨ Declare additional routines for string recycling 1388* ⟩ ≡
function search_string(search : str_number): str_number;
  label found;
  var result: str_number; s: str_number; { running index }
    len: integer; { length of searched string }
  begin result ← 0; len ← length(search);
  if len = 0 then { trivial case }
    begin result ← ""; goto found;
    end
  else begin s ← search − 1; { start search with newest string below s; search > 1! }
    while s > 255 do { first 256 strings depend on implementation!! }
      begin if length(s) = len then
        if str_eq_str(s, search) then
          begin result ← s; goto found;
          end;
      decr(s);
      end;
    end;
found: search_string ← result;
  end;
```

See also section 1389*.

This code is used in section 47*.

1389* The following routine is a variant of *make_string*. It searches the whole string pool for a string equal to the string currently built and returns a found string. Otherwise a new string is created and returned. Be cautious, you can not apply *flush_string* to a replaced string!

```
⟨ Declare additional routines for string recycling 1388* ⟩ +≡
function slow_make_string: str_number;
  label exit;
  var s: str_number; { result of search_string }
    t: str_number; { new string }
  begin t ← make_string; s ← search_string(t);
  if s > 0 then
    begin flush_string; slow_make_string ← s; return;
    end;
  slow_make_string ← t;
exit: end;
```

1390* More changes for Web2c. Sometimes, recursive calls to the *expand* routine may cause exhaustion of the run-time calling stack, resulting in forced execution stops by the operating system. To diminish the chance of this happening, a counter is used to keep track of the recursion depth, in conjunction with a constant called *expand_depth*.

This does not catch all possible infinite recursion loops, just the ones that exhaust the application calling stack. The actual maximum value of *expand_depth* is outside of our control, but the initial setting of 10000 should be enough to prevent problems.

```
⟨ Global variables 13 ⟩ +≡
expand_depth_count: integer;
```

1391* ⟨ Set initial values of key variables 21 ⟩ +≡

```
expand_depth_count ← 0;
```

1392* When *scan_file_name* starts it looks for a *left_brace* (skipping `\relax`es, as other `\toks`-like primitives). If a *left_brace* is found, then the procedure scans a file name contained in a balanced token list, expanding tokens as it goes. When the scanner finds the balanced token list, it is converted into a string and fed character-by-character to *more_name* to do its job the same as in the "normal" file name scanning.

```
procedure scan_file_name_braced;
  var save_scanner_status: small_number; { scanner_status upon entry }
    save_def_ref: pointer; { def_ref upon entry, important if inside '\message }
    save_cur_cs: pointer; s: str_number; { temp string }
    p: pointer; { temp pointer }
    i: integer; { loop tally }
    save_stop_at_space: boolean; { this should be in tex.ch }
    dummy: boolean; { Initializing }
  begin save_scanner_status ← scanner_status; { scan_toks sets scanner_status to absorbing }
  save_def_ref ← def_ref; { scan_toks uses def_ref to point to the token list just read }
  save_cur_cs ← cur_cs; { we set cur_cs back a few tokens to use in runaway errors }
    { Scanning a token list }
  cur_cs ← warning_index; { for possible runaway error }
    { mimick call_func from pdfTeX }
  if scan_toks(false, true) ≠ 0 then do_nothing; { actually do the scanning }
      { s ← tokens_to_string(def_ref); }
  old_setting ← selector; selector ← new_string; show_token_list(link(def_ref), null, pool_size − pool_ptr);
  selector ← old_setting; s ← make_string; { turns the token list read in a string to input }
    { Restoring some variables }
  delete_token_ref(def_ref); { remove the token list from memory }
  def_ref ← save_def_ref; { and restore def_ref }
  cur_cs ← save_cur_cs; { restore cur_cs }
  scanner_status ← save_scanner_status; { restore scanner_status }
    { Passing the read string to the input machinery }
  save_stop_at_space ← stop_at_space; { save stop_at_space }
  stop_at_space ← false; { set stop_at_space to false to allow spaces in file names }
  begin_name;
  for i ← str_start[s] to str_start[s + 1] − 1 do dummy ← more_name(str_pool[i]);
        { add each read character to the current file name }
  stop_at_space ← save_stop_at_space; { restore stop_at_space }
  end;
```

1393:* System-dependent changes for MLTEX. The boolean variable *mltex_p* is set by web2c according to the given command line option (or an entry in the configuration file) before any TEX function is called.

⟨ Global variables 13 ⟩ +≡
mltex_p: *boolean*;

1394:* The boolean variable *mltex_enabled_p* is used to enable MLTEX's character substitution. It is initialized to *false*. When loading a `FMT` it is set to the value of the boolean *mltex_p* saved in the `FMT` file. Additionally it is set to the value of *mltex_p* in IniTEX.

⟨ Global variables 13 ⟩ +≡
mltex_enabled_p: *boolean*; { enable character substitution }

1395:* ⟨ Set initial values of key variables 21 ⟩ +≡
mltex_enabled_p ← *false*;

1396* The function *effective_char* computes the effective character with respect to font information. The effective character is either the base character part of a character substitution definition, if the character does not exist in the font or the character itself.

Inside *effective_char* we can not use *char_info* because the macro *char_info* uses *effective_char* calling this function a second time with the same arguments.

If neither the character c exists in font f nor a character substitution for c was defined, you can not use the function value as a character offset in *char_info* because it will access an undefined or invalid *font_info* entry! Therefore inside *char_info* and in other places, *effective_char*'s boolean parameter *err_p* is set to *true* to issue a warning and return the incorrect replacement, but always existing character *font_bc*[f].

```
⟨ Declare additional functions for MLTEX 1396* ⟩ ≡
function effective_char(err_p : boolean; f : internal_font_number; c : quarterword): integer;
  label found;
  var base_c: integer;  { or eightbits: replacement base character }
    result: integer;  { or quarterword }
  begin result ← c;  { return c unless it does not exist in the font }
  if ¬mltex_enabled_p then goto found;
  if font_ec[f] ≥ qo(c) then
    if font_bc[f] ≤ qo(c) then
      if char_exists(orig_char_info(f)(c)) then  { N.B.: not char_info(f)(c) }
        goto found;
  if qo(c) ≥ char_sub_def_min then
    if qo(c) ≤ char_sub_def_max then
      if char_list_exists(qo(c)) then
        begin base_c ← char_list_char(qo(c)); result ← qi(base_c);  { return base_c }
        if ¬err_p then goto found;
        if font_ec[f] ≥ base_c then

              begin effective_char_info ← ci; return;
              end;
            end;
        end;
  effective_char_info ← null_character;
exit: end;
```

1398:* This code is called for a virtual character c in *hlist_out* during *ship_out*. It tries to built a character substitution construct for c generating appropriate `DVI` code using the character substitution definition for this character. If a valid character substitution exists `DVI` code is created as if *make_accent* was used. In all other cases the status of the substitution for this character has been changed between the creation of the character node in the hlist and the output of the page—the created `DVI` code will be correct but the visual result will be undefined.

Former MLTEX versions have replaced the character node by a sequence of character, box, and accent kern nodes splicing them into the original horizontal list. This version does not do this to avoid a) a memory overflow at this processing stage, b) additional code to add a pointer to the previous node needed for the replacement, and c) to avoid wrong code resulting in anomalies because of the use within a `\leaders` box.

```
⟨ Output a substitution, goto continue if not possible 1398* ⟩ ≡
  begin ⟨ Get substitution information, check it, goto found if all is ok, otherwise goto continue 1400* ⟩;
found: ⟨ Print character substitution tracing log 1401* ⟩;
  ⟨ Rebuild character using substitution information 1402* ⟩;
  end
```

This code is used in section 620*.

1399* The global variables for the code to substitute a virtual character can be declared as local. Nonetheless we declare them as global to avoid stack overflows because *hlist_out* can be called recursively.

```
⟨ Global variables 13 ⟩ +≡
accent_c, base_c, replace_c: integer;
ia_c, ib_c: four_quarters; { accent and base character information }
base_slant, accent_slant: real; { amount of slant }
base_x_height: scaled; { accent is designed for characters of this height }
base_width, base_height: scaled; { height and width for base character }
accent_width, accent_height: scaled; { height and width for accent }
delta: scaled; { amount of right shift }
```

1400* Get the character substitution information in *char_sub_code* for the character *c*. The current code checks that the substitution exists and is valid and all substitution characters exist in the font, so we can *not* substitute a character used in a substitution. This simplifies the code because we have not to check for cycles in all character substitution definitions.

```
⟨ Get substitution information, check it, goto found if all is ok, otherwise goto continue 1400* ⟩ ≡
  if qo(c) ≥ char_sub_def_min then
    if qo(c) ≤ char_sub_def_max then
      if char_list_exists(qo(c)) then
        begin base_c ← char_list_char(qo(c)); accent_c ← char_list_accent(qo(c));
        if (font_ec[f] ≥ base_c) then
          if (font_bc[f] ≤ base_c) then
            if (font_ec[f] ≥ accent_c) then
              if (font_bc[f] ≤ accent_c) then
                begin ia_c ← char_info(f)(qi(accent_c)); ib_c ← char_info(f)(qi(base_c));
                if char_exists(ib_c) then
                  if char_exists(ia_c) then goto found;
                end;
        begin_diagnostic; print_nl("Missing␣character:␣Incomplete␣substitution␣");
        print_ASCII(qo(c)); print("␣=␣"); print_ASCII(accent_c); print("␣"); print_ASCII(base_c);
        print("␣in␣font␣"); slow_print(font_name[f]); print_char("!"); end_diagnostic(false);
        goto continue;
        end;
  begin_diagnostic; print_nl("Missing␣character:␣There␣is␣no␣"); print("substitution␣for␣");
  print_ASCII(qo(c)); print("␣in␣font␣"); slow_print(font_name[f]); print_char("!");
  end_diagnostic(false); goto continue
```

This code is used in section 1398*.

1401* For *tracinglostchars* > 99 the substitution is shown in the log file.

```
⟨ Print character substitution tracing log 1401* ⟩ ≡
  if tracing_lost_chars > 99 then
    begin begin_diagnostic; print_nl("Using␣character␣substitution:␣"); print_ASCII(qo(c));
    print("␣=␣"); print_ASCII(accent_c); print("␣"); print_ASCII(base_c); print("␣in␣font␣");
    slow_print(font_name[f]); print_char("."); end_diagnostic(false);
    end
```

This code is used in section 1398*.

1402* This outputs the accent and the base character given in the substitution. It uses code virtually identical to the *make_accent* procedure, but without the node creation steps.

Additionally if the accent character has to be shifted vertically it does *not* create the same code. The original routine in *make_accent* and former versions of MLTEX creates a box node resulting in *push* and *pop* operations, whereas this code simply produces vertical positioning operations. This can influence the pixel rounding algorithm in some `DVI` drivers—and therefore will probably be changed in one of the next MLTEX versions.

```
⟨ Rebuild character using substitution information 1402* ⟩ ≡
  base_x_height ← x_height(f); base_slant ← slant(f)/float_constant(65536); accent_slant ← base_slant;
      { slant of accent character font }

1403* Dumping MLTEX-related material. This is just the flag in the format that tells us whether MLTEX is enabled.

```
⟨ Dump MLTEX-specific data 1403* ⟩ ≡
  dump_int("4D4C5458"); { MLTEX's magic constant: "MLTX" }
  if mltex_p then dump_int(1)
  else dump_int(0);
```

This code is used in section 1302*.

1404.* Undump MLTEX-related material, which is just a flag in the format that tells us whether MLTEX is enabled.

```
⟨ Undump MLTEX-specific data 1404* ⟩ ≡
  undump_int(x);  { check magic constant of MLTEX }
  if x ≠ "4D4C5458 then goto bad_fmt;
  undump_int(x);  { undump mltex_p flag into mltex_enabled_p }
  if x = 1 then mltex_enabled_p ← true
  else if x ≠ 0 then goto bad_fmt;
```

This code is used in section 1303*.

1405* System-dependent changes for encTEX.

define *encTeX_banner* ≡ ´␣encTeX␣v.␣Jun.␣2004´

1406* The boolean variable *enctex_p* is set by web2c according to the given command line option (or an entry in the configuration file) before any TEX function is called.

⟨ Global variables 13 ⟩ +≡
enctex_p: *boolean*;

1407* The boolean variable *enctex_enabled_p* is used to enable encTEX's primitives. It is initialised to *false*. When loading a FMT it is set to the value of the boolean *enctex_p* saved in the FMT file. Additionally it is set to the value of *enctex_p* in IniTEX.

⟨ Global variables 13 ⟩ +≡
enctex_enabled_p: *boolean*; { enable encTeX }

1408* ⟨ Set initial values of key variables 21 ⟩ +≡
enctex_enabled_p ← *false*;

1409:* Auxiliary functions/procedures for encTEX (by Petr Olsak) follow. These functions implement the `\mubyte` code to convert the multibytes in *buffer* to one byte or to one control sequence. These functions manipulate a mubyte tree: each node of this tree is token list with n+1 tokens (first token consist the byte from the byte sequence itself and the other tokens point to the branches). If you travel from root of the tree to a leaf then you find exactly one byte sequence which we have to convert to one byte or control sequence. There are two variants of the leaf: the "definitive end" or the "middle leaf" if a longer byte sequence exists and the mubyte tree continues under this leaf. First variant is implemented as one memory word where the link part includes the token to which we have to convert and type part includes the number 60 (normal conversion) or 1..52 (insert the control sequence). The second variant of "middle leaf" is implemented as two memory words: first one has a type advanced by 64 and link points to the second word where info part includes the token to which we have to convert and link points to the next token list with the branches of the subtree.

The inverse: one byte to multi byte (for log printing and `\write` printing) is implemented via a pool. Each multibyte sequence is stored in a pool as a string and *mubyte_write*[*printed char*] points to this string.

```
define new_mubyte_node ≡ link(p) ← get_avail; p ← link(p); info(p) ← get_avail; p ← info(p)
define subinfo(#) ≡ subtype(#)
```

1415.* This function used to be in pdftex, but is useful in tex too.

```
function get_nullstr: str_number;
  begin get_nullstr ← "";
  end;
```

1416.* Index. Here is where you can find all uses of each identifier in the program, with underlined entries pointing to where the identifier was defined. If the identifier is only one letter long, however, you get to see only the underlined entries. *All references are to section numbers instead of page numbers.*

This index also lists error messages and other aspects of the program that you might want to look up some day. For example, the entry for "system dependencies" lists all sections that should receive special attention from people who are installing TEX in a new operating environment. A list of various things that can't happen appears under "this can't happen". Approximately 40 sections are listed under "inner loop"; these account for about 60% of TEX's running time, exclusive of input and output.

The following sections were changed by the change file: 2, 4, 6, 7, 8, 11, 12, 16, 19, 20, 23, 24, 26, 27, 28, 30, 31, 32, 33, 34, 35, 37, 38, 39, 47, 49, 51, 52, 53, 54, 59, 61, 71, 73, 74, 81, 82, 84, 93, 94, 95, 104, 109, 110, 111, 112, 113, 116, 144, 165, 174, 176, 186, 209, 211, 213, 215, 219, 220, 222, 230, 236, 237, 238, 240, 241, 252, 253, 256, 257, 258, 260, 262, 265, 266, 271, 283, 290, 301, 304, 306, 308, 318, 328, 331, 332, 338, 339, 341, 343, 354, 355, 356, 357, 363, 366, 372, 414, 484, 501, 513, 514, 515, 516, 517, 518, 519, 520, 521, 523, 524, 525, 526, 530, 532, 534, 536, 537, 548, 549, 550, 551, 552, 554, 560, 561, 563, 564, 570, 573, 575, 576, 582, 592, 595, 597, 598, 599, 602, 617, 619, 620, 621, 640, 642, 708, 722, 740, 749, 920, 921, 923, 924, 925, 926, 928, 930, 931, 934, 939, 940, 941, 943, 944, 945, 946, 947, 950, 951, 958, 960, 963, 964, 965, 966, 1034, 1036, 1049, 1091, 1135, 1139, 1167, 1211, 1215, 1219, 1220, 1221, 1222, 1223, 1224, 1230, 1231, 1232, 1252, 1257, 1260, 1265, 1275, 1279, 1280, 1283, 1301, 1302, 1303, 1305, 1306, 1307, 1308, 1309, 1310, 1311, 1312, 1314, 1315, 1316, 1317, 1318, 1319, 1320, 1321, 1322, 1323, 1324, 1325, 1327, 1332, 1333, 1334, 1335, 1337, 1338, 1339, 1341, 1344, 1348, 1350, 1354, 1355, 1356, 1368, 1370, 1373, 1374, 1379, 1380, 1381, 1382, 1383, 1384, 1385, 1386, 1387, 1388, 1389, 1390, 1391, 1392, 1393, 1394, 1395, 1396, 1397, 1398, 1399, 1400, 1401, 1402, 1403, 1404, 1405, 1406, 1407, 1408, 1409, 1410, 1411, 1412, 1413, 1414, 1415, 1416.

⟨ Accumulate the constant until *cur_tok* is not a suitable digit 445 ⟩ Used in section 444.
⟨ Add the width of node *s* to *act_width* 871 ⟩ Used in section 869.
⟨ Add the width of node *s* to *break_width* 842 ⟩ Used in section 840.
⟨ Add the width of node *s* to *disc_width* 870 ⟩ Used in section 869.
⟨ Adjust for the magnification ratio 457 ⟩ Used in section 453.
⟨ Adjust for the setting of `\globaldefs` 1214 ⟩ Used in section 1211*.
⟨ Adjust *shift_up* and *shift_down* for the case of a fraction line 746 ⟩ Used in section 743.
⟨ Adjust *shift_up* and *shift_down* for the case of no fraction line 745 ⟩ Used in section 743.
⟨ Advance *cur_p* to the node following the present string of characters 867 ⟩ Used in section 866.
⟨ Advance past a whatsit node in the *line_break* loop 1362 ⟩ Used in section 866.
⟨ Advance past a whatsit node in the pre-hyphenation loop 1363 ⟩ Used in section 896.
⟨ Advance *r*; **goto** *found* if the parameter delimiter has been fully matched, otherwise **goto** *continue* 394 ⟩ Used in section 392.
⟨ Allocate entire node *p* and **goto** *found* 129 ⟩ Used in section 127.
⟨ Allocate from the top of node *p* and **goto** *found* 128 ⟩ Used in section 127.
⟨ Apologize for inability to do the operation now, unless `\unskip` follows non-glue 1106 ⟩ Used in section 1105.
⟨ Apologize for not loading the font, **goto** *done* 567 ⟩ Used in section 566.
⟨ Append a ligature and/or kern to the translation; **goto** *continue* if the stack of inserted ligatures is nonempty 910 ⟩ Used in section 906.
⟨ Append a new leader node that uses *cur_box* 1078 ⟩ Used in section 1075.
⟨ Append a new letter or a hyphen level 962 ⟩ Used in section 961.
⟨ Append a new letter or hyphen 937 ⟩ Used in section 935.
⟨ Append a normal inter-word space to the current list, then **goto** *big_switch* 1041 ⟩ Used in section 1030.
⟨ Append a penalty node, if a nonzero penalty is appropriate 890 ⟩ Used in section 880.
⟨ Append an insertion to the current page and **goto** *contribute* 1008 ⟩ Used in section 1000.
⟨ Append any *new_hlist* entries for *q*, and any appropriate penalties 767 ⟩ Used in section 760.
⟨ Append box *cur_box* to the current list, shifted by *box_context* 1076 ⟩ Used in section 1075.
⟨ Append character *cur_chr* and the following characters (if any) to the current hlist in the current font; **goto** *reswitch* when a non-character has been fetched 1034* ⟩ Used in section 1030.
⟨ Append characters of $hu[j\,..]$ to *major_tail*, advancing *j* 917 ⟩ Used in section 916.
⟨ Append inter-element spacing based on *r_type* and *t* 766 ⟩ Used in section 760.
⟨ Append tabskip glue and an empty box to list *u*, and update *s* and *t* as the prototype nodes are passed 809 ⟩ Used in section 808.
⟨ Append the accent with appropriate kerns, then set $p \leftarrow q$ 1125 ⟩ Used in section 1123.
⟨ Append the current tabskip glue to the preamble list 778 ⟩ Used in section 777.
⟨ Append the display and perhaps also the equation number 1204 ⟩ Used in section 1199.
⟨ Append the glue or equation number following the display 1205 ⟩ Used in section 1199.
⟨ Append the glue or equation number preceding the display 1203 ⟩ Used in section 1199.
⟨ Append the new box to the current vertical list, followed by the list of special nodes taken out of the box by the packager 888 ⟩ Used in section 880.
⟨ Append the value *n* to list *p* 938 ⟩ Used in section 937.
⟨ Assign the values *depth_threshold* ← *show_box_depth* and *breadth_max* ← *show_box_breadth* 236* ⟩ Used in section 198.
⟨ Assignments 1217, 1218, 1221*, 1224*, 1225, 1226, 1228, 1232*, 1234, 1235, 1241, 1242, 1248, 1252*, 1253, 1256, 1264 ⟩ Used in section 1211*.
⟨ Attach list *p* to the current list, and record its length; then finish up and **return** 1120 ⟩ Used in section 1119.
⟨ Attach the limits to *y* and adjust $height(v)$, $depth(v)$ to account for their presence 751 ⟩ Used in section 750.
⟨ Back up an outer control sequence so that it can be reread 337 ⟩ Used in section 336.
⟨ Basic printing procedures 57, 58, 59*, 60, 62, 63, 64, 65, 262*, 263, 518*, 699, 1355*, 1382*, 1384*, 1409*, 1411* ⟩ Used in section 4*.
⟨ Break the current page at node *p*, put it in box 255, and put the remaining nodes on the contribution list 1017 ⟩ Used in section 1014.

⟨ Break the paragraph at the chosen breakpoints, justify the resulting lines to the correct widths, and append them to the current vertical list 876 ⟩ Used in section 815.
⟨ Calculate the length, l, and the shift amount, s, of the display lines 1149 ⟩ Used in section 1145.
⟨ Calculate the natural width, w, by which the characters of the final line extend to the right of the reference point, plus two ems; or set $w \leftarrow max\_dimen$ if the non-blank information on that line is affected by stretching or shrinking 1146 ⟩ Used in section 1145.
⟨ Call the packaging subroutine, setting *just_box* to the justified box 889 ⟩ Used in section 880.
⟨ Call *try_break* if *cur_p* is a legal breakpoint; on the second pass, also try to hyphenate the next word, if *cur_p* is a glue node; then advance *cur_p* to the next node of the paragraph that could possibly be a legal breakpoint 866 ⟩ Used in section 863.
⟨ Carry out a ligature replacement, updating the cursor structure and possibly advancing j; **goto** *continue* if the cursor doesn't advance, otherwise **goto** *done* 911 ⟩ Used in section 909.
⟨ Case statement to copy different types and set *words* to the number of initial words not yet copied 206 ⟩ Used in section 205.
⟨ Cases for noads that can follow a *bin_noad* 733 ⟩ Used in section 728.
⟨ Cases for nodes that can appear in an mlist, after which we **goto** *done_with_node* 730 ⟩ Used in section 728.
⟨ Cases of *flush_node_list* that arise in mlists only 698 ⟩ Used in section 202.
⟨ Cases of *handle_right_brace* where a *right_brace* triggers a delayed action 1085, 1100, 1118, 1132, 1133, 1168, 1173, 1186 ⟩ Used in section 1068.
⟨ Cases of *main_control* that are for extensions to TEX 1347 ⟩ Used in section 1045.
⟨ Cases of *main_control* that are not part of the inner loop 1045 ⟩ Used in section 1030.
⟨ Cases of *main_control* that build boxes and lists 1056, 1057, 1063, 1067, 1073, 1090, 1092, 1094, 1097, 1102, 1104, 1109, 1112, 1116, 1122, 1126, 1130, 1134, 1137, 1140, 1150, 1154, 1158, 1162, 1164, 1167*, 1171, 1175, 1180, 1190, 1193 ⟩ Used in section 1045.
⟨ Cases of *main_control* that don't depend on *mode* 1210, 1268, 1271, 1274, 1276, 1285, 1290 ⟩ Used in section 1045.
⟨ Cases of *print_cmd_chr* for symbolic printing of primitives 227, 231, 239, 249, 266*, 335, 377, 385, 412, 417, 469, 488, 492, 781, 984, 1053, 1059, 1072, 1089, 1108, 1115, 1143, 1157, 1170, 1179, 1189, 1209, 1220*, 1223*, 1231*, 1251, 1255, 1261, 1263, 1273, 1278, 1287, 1292, 1295, 1346 ⟩ Used in section 298.
⟨ Cases of *show_node_list* that arise in mlists only 690 ⟩ Used in section 183.
⟨ Cases where character is ignored 345 ⟩ Used in section 344.
⟨ Change buffered instruction to y or w and **goto** *found* 613 ⟩ Used in section 612.
⟨ Change buffered instruction to z or x and **goto** *found* 614 ⟩ Used in section 612.
⟨ Change current mode to $-vmode$ for `\halign`, $-hmode$ for `\valign` 775 ⟩ Used in section 774.
⟨ Change discretionary to compulsory and set *disc_break* $\leftarrow$ *true* 882 ⟩ Used in section 881.
⟨ Change font *dvi_f* to f 621* ⟩ Used in section 620*.
⟨ Change state if necessary, and **goto** *switch* if the current character should be ignored, or **goto** *reswitch* if the current character changes to another 344 ⟩ Used in section 343*.
⟨ Change the case of the token in p, if a change is appropriate 1289 ⟩ Used in section 1288.
⟨ Change the current style and **goto** *delete_q* 763 ⟩ Used in section 761.
⟨ Change the interaction level and **return** 86 ⟩ Used in section 84*.
⟨ Change this node to a style node followed by the correct choice, then **goto** *done_with_node* 731 ⟩ Used in section 730.
⟨ Character k cannot be printed 49* ⟩ Used in section 48.
⟨ Character s is the current new-line character 244 ⟩ Used in sections 58 and 59*.
⟨ Check flags of unavailable nodes 170 ⟩ Used in section 167.
⟨ Check for charlist cycle 570* ⟩ Used in section 569.
⟨ Check for improper alignment in displayed math 776 ⟩ Used in section 774.
⟨ Check if node p is a new champion breakpoint; then **goto** *done* if p is a forced break or if the page-so-far is already too full 974 ⟩ Used in section 972.
⟨ Check if node p is a new champion breakpoint; then if it is time for a page break, prepare for output, and either fire up the user's output routine and **return** or ship out the page and **goto** *done* 1005 ⟩ Used in section 997.

⟨ Check single-word *avail* list 168 ⟩ Used in section 167.
⟨ Check that another $ follows 1197 ⟩ Used in sections 1194, 1194, and 1206.
⟨ Check that the necessary fonts for math symbols are present; if not, flush the current math lists and set *danger* ← *true* 1195 ⟩ Used in sections 1194 and 1194.
⟨ Check that the nodes following *hb* permit hyphenation and that at least *l_hyf* + *r_hyf* letters have been found, otherwise **goto** *done1* 899 ⟩ Used in section 894.
⟨ Check the "constant" values for consistency 14, 111*, 290*, 522, 1249 ⟩ Used in section 1332*.
⟨ Check variable-size *avail* list 169 ⟩ Used in section 167.
⟨ Clean up the memory by removing the break nodes 865 ⟩ Used in sections 815 and 863.
⟨ Clear dimensions to zero 650 ⟩ Used in sections 649 and 668.
⟨ Clear off top level from *save_stack* 282 ⟩ Used in section 281.
⟨ Close the format file 1329 ⟩ Used in section 1302*.
⟨ Coerce glue to a dimension 451 ⟩ Used in sections 449 and 455.
⟨ Compiler directives 9 ⟩ Used in section 4*.
⟨ Complain about an undefined family and set *cur_i* null 723 ⟩ Used in section 722*.
⟨ Complain about an undefined macro 370 ⟩ Used in section 367.
⟨ Complain about missing \endcsname 373 ⟩ Used in section 372*.
⟨ Complain about unknown unit and **goto** *done2* 459 ⟩ Used in section 458.
⟨ Complain that \the can't do this; give zero result 428 ⟩ Used in section 413.
⟨ Complain that the user should have said \mathaccent 1166 ⟩ Used in section 1165.
⟨ Compleat the incompleat noad 1185 ⟩ Used in section 1184.
⟨ Complete a potentially long \show command 1298 ⟩ Used in section 1293.
⟨ Compute result of *multiply* or *divide*, put it in *cur_val* 1240 ⟩ Used in section 1236.
⟨ Compute result of *register* or *advance*, put it in *cur_val* 1238 ⟩ Used in section 1236.
⟨ Compute the amount of skew 741 ⟩ Used in section 738.
⟨ Compute the badness, *b*, of the current page, using *awful_bad* if the box is too full 1007 ⟩ Used in section 1005.
⟨ Compute the badness, *b*, using *awful_bad* if the box is too full 975 ⟩ Used in section 974.
⟨ Compute the demerits, *d*, from *r* to *cur_p* 859 ⟩ Used in section 855.
⟨ Compute the discretionary *break_width* values 840 ⟩ Used in section 837.
⟨ Compute the hash code *h* 261 ⟩ Used in section 259.
⟨ Compute the magic offset 765 ⟩ Used in section 1337*.
⟨ Compute the minimum suitable height, *w*, and the corresponding number of extension steps, *n*; also set *width*(*b*) 714 ⟩ Used in section 713.
⟨ Compute the new line width 850 ⟩ Used in section 835.
⟨ Compute the register location *l* and its type *p*; but **return** if invalid 1237 ⟩ Used in section 1236.
⟨ Compute the sum of two glue specs 1239 ⟩ Used in section 1238.
⟨ Compute the trie op code, *v*, and set *l* ← 0 965* ⟩ Used in section 963*.
⟨ Compute the values of *break_width* 837 ⟩ Used in section 836.
⟨ Consider a node with matching width; **goto** *found* if it's a hit 612 ⟩ Used in section 611.
⟨ Consider the demerits for a line from *r* to *cur_p*; deactivate node *r* if it should no longer be active; then **goto** *continue* if a line from *r* to *cur_p* is infeasible, otherwise record a new feasible break 851 ⟩ Used in section 829.
⟨ Constants in the outer block 11* ⟩ Used in section 4*.
⟨ Construct a box with limits above and below it, skewed by *delta* 750 ⟩ Used in section 749*.
⟨ Construct a sub/superscript combination box *x*, with the superscript offset by *delta* 759 ⟩ Used in section 756.
⟨ Construct a subscript box *x* when there is no superscript 757 ⟩ Used in section 756.
⟨ Construct a superscript box *x* 758 ⟩ Used in section 756.
⟨ Construct a vlist box for the fraction, according to *shift_up* and *shift_down* 747 ⟩ Used in section 743.
⟨ Construct an extensible character in a new box *b*, using recipe *rem_byte*(*q*) and font *f* 713 ⟩ Used in section 710.
⟨ Contribute an entire group to the current parameter 399 ⟩ Used in section 392.

⟨ Contribute the recently matched tokens to the current parameter, and **goto** *continue* if a partial match is still in effect; but abort if $s = null$ 397 ⟩ Used in section 392.
⟨ Convert a final *bin_noad* to an *ord_noad* 729 ⟩ Used in sections 726 and 728.
⟨ Convert *cur_val* to a lower level 429 ⟩ Used in section 413.
⟨ Convert math glue to ordinary glue 732 ⟩ Used in section 730.
⟨ Convert *nucleus*(*q*) to an hlist and attach the sub/superscripts 754 ⟩ Used in section 728.
⟨ Copy the tabskip glue between columns 795 ⟩ Used in section 791.
⟨ Copy the templates from node *cur_loop* into node *p* 794 ⟩ Used in section 793.
⟨ Copy the token list 466 ⟩ Used in section 465.
⟨ Create a character node *p* for *nucleus*(*q*), possibly followed by a kern node for the italic correction, and set *delta* to the italic correction if a subscript is present 755 ⟩ Used in section 754.
⟨ Create a character node *q* for the next character, but set $q \leftarrow null$ if problems arise 1124 ⟩ Used in section 1123.
⟨ Create a new glue specification whose width is *cur_val*; scan for its stretch and shrink components 462 ⟩ Used in section 461.
⟨ Create a page insertion node with $subtype(r) = qi(n)$, and include the glue correction for box *n* in the current page state 1009 ⟩ Used in section 1008.
⟨ Create an active breakpoint representing the beginning of the paragraph 864 ⟩ Used in section 863.
⟨ Create and append a discretionary node as an alternative to the unhyphenated word, and continue to develop both branches until they become equivalent 914 ⟩ Used in section 913.
⟨ Create equal-width boxes *x* and *z* for the numerator and denominator, and compute the default amounts *shift_up* and *shift_down* by which they are displaced from the baseline 744 ⟩ Used in section 743.
⟨ Create new active nodes for the best feasible breaks just found 836 ⟩ Used in section 835.
⟨ Create the *format_ident*, open the format file, and inform the user that dumping has begun 1328 ⟩ Used in section 1302*.
⟨ Current *mem* equivalent of glue parameter number *n* 224 ⟩ Used in sections 152 and 154.
⟨ Deactivate node *r* 860 ⟩ Used in section 851.
⟨ Declare action procedures for use by *main_control* 1043, 1047, 1049*, 1050, 1051, 1054, 1060, 1061, 1064, 1069, 1070, 1075, 1079, 1084, 1086, 1091*, 1093, 1095, 1096, 1099, 1101, 1103, 1105, 1110, 1113, 1117, 1119, 1123, 1127, 1129, 1131, 1135*, 1136, 1138, 1142, 1151, 1155, 1159, 1160, 1163, 1165, 1172, 1174, 1176, 1181, 1191, 1194, 1200, 1211*, 1270, 1275*, 1279*, 1288, 1293, 1302*, 1348*, 1376, 1414* ⟩ Used in section 1030.
⟨ Declare additional functions for MLTEX 1396*, 1397* ⟩ Used in section 560*.
⟨ Declare additional routines for encTEX 1410* ⟩ Used in section 332*.
⟨ Declare additional routines for string recycling 1388*, 1389* ⟩ Used in section 47*.
⟨ Declare math construction procedures 734, 735, 736, 737, 738, 743, 749*, 752, 756, 762 ⟩ Used in section 726.
⟨ Declare procedures for preprocessing hyphenation patterns 944*, 948, 949, 953, 957, 959, 960*, 966* ⟩ Used in section 942.
⟨ Declare procedures needed for displaying the elements of mlists 691, 692, 694 ⟩ Used in section 179.
⟨ Declare procedures needed in *do_extension* 1349, 1350* ⟩ Used in section 1348*.
⟨ Declare procedures needed in *hlist_out*, *vlist_out* 1368*, 1370*, 1373* ⟩ Used in section 619*.
⟨ Declare procedures that scan font-related stuff 577, 578 ⟩ Used in section 409.
⟨ Declare procedures that scan restricted classes of integers 433, 434, 435, 436, 437, 1385* ⟩ Used in section 409.
⟨ Declare subprocedures for *line_break* 826, 829, 877, 895, 942 ⟩ Used in section 815.
⟨ Declare subprocedures for *prefixed_command* 1215*, 1229, 1236, 1243, 1244, 1245, 1246, 1247, 1257*, 1265* ⟩ Used in section 1211*.
⟨ Declare subprocedures for *var_delimiter* 709, 711, 712 ⟩ Used in section 706.
⟨ Declare the function called *fin_mlist* 1184 ⟩ Used in section 1174.
⟨ Declare the function called *open_fmt_file* 524* ⟩ Used in section 1303*.
⟨ Declare the function called *reconstitute* 906 ⟩ Used in section 895.
⟨ Declare the procedure called *align_peek* 785 ⟩ Used in section 800.
⟨ Declare the procedure called *fire_up* 1012 ⟩ Used in section 994.
⟨ Declare the procedure called *get_preamble_token* 782 ⟩ Used in section 774.

⟨ Declare the procedure called *handle_right_brace* 1068 ⟩ Used in section 1030.
⟨ Declare the procedure called *init_span* 787 ⟩ Used in section 786.
⟨ Declare the procedure called *insert_relax* 379 ⟩ Used in section 366*.
⟨ Declare the procedure called *macro_call* 389 ⟩ Used in section 366*.
⟨ Declare the procedure called *print_cmd_chr* 298 ⟩ Used in section 252*.
⟨ Declare the procedure called *print_skip_param* 225 ⟩ Used in section 179.
⟨ Declare the procedure called *restore_trace* 284 ⟩ Used in section 281.
⟨ Declare the procedure called *runaway* 306* ⟩ Used in section 119.
⟨ Declare the procedure called *show_token_list* 292 ⟩ Used in section 119.
⟨ Decry the invalid character and **goto** *restart* 346 ⟩ Used in section 344.
⟨ Delete $c -$ "0" tokens and **goto** *continue* 88 ⟩ Used in section 84*.
⟨ Delete the page-insertion nodes 1019 ⟩ Used in section 1014.
⟨ Destroy the t nodes following q, and make r point to the following node 883 ⟩ Used in section 882.
⟨ Determine horizontal glue shrink setting, then **return** or **goto** *common_ending* 664 ⟩ Used in section 657.
⟨ Determine horizontal glue stretch setting, then **return** or **goto** *common_ending* 658 ⟩ Used in section 657.
⟨ Determine the displacement, d, of the left edge of the equation, with respect to the line size z, assuming that $l = false$ 1202 ⟩ Used in section 1199.
⟨ Determine the shrink order 665 ⟩ Used in sections 664, 676, and 796.
⟨ Determine the stretch order 659 ⟩ Used in sections 658, 673, and 796.
⟨ Determine the value of $height(r)$ and the appropriate glue setting; then **return** or **goto** *common_ending* 672 ⟩ Used in section 668.
⟨ Determine the value of $width(r)$ and the appropriate glue setting; then **return** or **goto** *common_ending* 657 ⟩ Used in section 649.
⟨ Determine vertical glue shrink setting, then **return** or **goto** *common_ending* 676 ⟩ Used in section 672.
⟨ Determine vertical glue stretch setting, then **return** or **goto** *common_ending* 673 ⟩ Used in section 672.
⟨ Discard erroneous prefixes and **return** 1212 ⟩ Used in section 1211*.
⟨ Discard the prefixes \long and \outer if they are irrelevant 1213 ⟩ Used in section 1211*.
⟨ Dispense with trivial cases of void or bad boxes 978 ⟩ Used in section 977.
⟨ Display adjustment p 197 ⟩ Used in section 183.
⟨ Display box p 184 ⟩ Used in section 183.
⟨ Display choice node p 695 ⟩ Used in section 690.
⟨ Display discretionary p 195 ⟩ Used in section 183.
⟨ Display fraction noad p 697 ⟩ Used in section 690.
⟨ Display glue p 189 ⟩ Used in section 183.
⟨ Display insertion p 188 ⟩ Used in section 183.
⟨ Display kern p 191 ⟩ Used in section 183.
⟨ Display leaders p 190 ⟩ Used in section 189.
⟨ Display ligature p 193 ⟩ Used in section 183.
⟨ Display mark p 196 ⟩ Used in section 183.
⟨ Display math node p 192 ⟩ Used in section 183.
⟨ Display node p 183 ⟩ Used in section 182.
⟨ Display normal noad p 696 ⟩ Used in section 690.
⟨ Display penalty p 194 ⟩ Used in section 183.
⟨ Display rule p 187 ⟩ Used in section 183.
⟨ Display special fields of the unset node p 185 ⟩ Used in section 184.
⟨ Display the current context 312 ⟩ Used in section 311.
⟨ Display the insertion split cost 1011 ⟩ Used in section 1010.
⟨ Display the page break cost 1006 ⟩ Used in section 1005.
⟨ Display the token (m, c) 294 ⟩ Used in section 293.
⟨ Display the value of b 502 ⟩ Used in section 498.
⟨ Display the value of $glue\_set(p)$ 186* ⟩ Used in section 184.
⟨ Display the whatsit node p 1356* ⟩ Used in section 183.

⟨ Display token p, and **return** if there are problems 293 ⟩ Used in section 292.
⟨ Do first-pass processing based on *type*(q); **goto** *done_with_noad* if a noad has been fully processed, **goto** *check_dimensions* if it has been translated into *new_hlist*(q), or **goto** *done_with_node* if a node has been fully processed 728 ⟩ Used in section 727.
⟨ Do ligature or kern command, returning to *main_lig_loop* or *main_loop_wrapup* or *main_loop_move* 1040 ⟩ Used in section 1039.
⟨ Do magic computation 320 ⟩ Used in section 292.
⟨ Do some work that has been queued up for `\write` 1374* ⟩ Used in section 1373*.
⟨ Drop current token and complain that it was unmatched 1066 ⟩ Used in section 1064.
⟨ Dump MLTEX-specific data 1403* ⟩ Used in section 1302*.
⟨ Dump a couple more things and the closing check word 1326 ⟩ Used in section 1302*.
⟨ Dump constants for consistency check 1307* ⟩ Used in section 1302*.
⟨ Dump encTEX-specific data 1412* ⟩ Used in section 1302*.
⟨ Dump regions 1 to 4 of *eqtb* 1315* ⟩ Used in section 1313.
⟨ Dump regions 5 and 6 of *eqtb* 1316* ⟩ Used in section 1313.
⟨ Dump the array info for internal font number k 1322* ⟩ Used in section 1320*.
⟨ Dump the dynamic memory 1311* ⟩ Used in section 1302*.
⟨ Dump the font information 1320* ⟩ Used in section 1302*.
⟨ Dump the hash table 1318* ⟩ Used in section 1313.
⟨ Dump the hyphenation tables 1324* ⟩ Used in section 1302*.
⟨ Dump the string pool 1309* ⟩ Used in section 1302*.
⟨ Dump the table of equivalents 1313 ⟩ Used in section 1302*.
⟨ Dump *xord*, *xchr*, and *xprn* 1386* ⟩ Used in section 1307*.
⟨ Either append the insertion node p after node q, and remove it from the current page, or delete *node*(p) 1022 ⟩ Used in section 1020.
⟨ Either insert the material specified by node p into the appropriate box, or hold it for the next page; also delete node p from the current page 1020 ⟩ Used in section 1014.
⟨ Either process `\ifcase` or set b to the value of a boolean condition 501* ⟩ Used in section 498.
⟨ Empty the last bytes out of *dvi_buf* 599* ⟩ Used in section 642*.
⟨ Ensure that box 255 is empty after output 1028 ⟩ Used in section 1026.
⟨ Ensure that box 255 is empty before output 1015 ⟩ Used in section 1014.
⟨ Ensure that *trie_max* $\geq h + 256$ 954 ⟩ Used in section 953.
⟨ Enter a hyphenation exception 939* ⟩ Used in section 935.
⟨ Enter all of the patterns into a linked trie, until coming to a right brace 961 ⟩ Used in section 960*.
⟨ Enter as many hyphenation exceptions as are listed, until coming to a right brace; then **return** 935 ⟩ Used in section 934*.
⟨ Enter *skip_blanks* state, emit a space 349 ⟩ Used in section 347.
⟨ Error handling procedures 78, 81*, 82*, 93*, 94*, 95* ⟩ Used in section 4*.
⟨ Examine node p in the hlist, taking account of its effect on the dimensions of the new box, or moving it to the adjustment list; then advance p to the next node 651 ⟩ Used in section 649.
⟨ Examine node p in the vlist, taking account of its effect on the dimensions of the new box; then advance p to the next node 669 ⟩ Used in section 668.
⟨ Expand a nonmacro 367 ⟩ Used in section 366*.
⟨ Expand macros in the token list and make *link*(*def_ref*) point to the result 1371 ⟩ Used in section 1370*.
⟨ Expand the next part of the input 478 ⟩ Used in section 477.
⟨ Expand the token after the next token 368 ⟩ Used in section 367.
⟨ Explain that too many dead cycles have occurred in a row 1024 ⟩ Used in section 1012.
⟨ Express astonishment that no number was here 446 ⟩ Used in section 444.
⟨ Express consternation over the fact that no alignment is in progress 1128 ⟩ Used in section 1127.
⟨ Express shock at the missing left brace; **goto** *found* 475 ⟩ Used in section 474.
⟨ Feed the macro body and its parameters to the scanner 390 ⟩ Used in section 389.
⟨ Fetch a box dimension 420 ⟩ Used in section 413.

⟨ Fetch a character code from some table 414* ⟩ Used in section 413.
⟨ Fetch a font dimension 425 ⟩ Used in section 413.
⟨ Fetch a font integer 426 ⟩ Used in section 413.
⟨ Fetch a register 427 ⟩ Used in section 413.
⟨ Fetch a token list or font identifier, provided that *level* = *tok_val* 415 ⟩ Used in section 413.
⟨ Fetch an internal dimension and **goto** *attach_sign*, or fetch an internal integer 449 ⟩ Used in section 448.
⟨ Fetch an item in the current node, if appropriate 424 ⟩ Used in section 413.
⟨ Fetch something on the *page_so_far* 421 ⟩ Used in section 413.
⟨ Fetch the *dead_cycles* or the *insert_penalties* 419 ⟩ Used in section 413.
⟨ Fetch the *par_shape* size 423 ⟩ Used in section 413.
⟨ Fetch the *prev_graf* 422 ⟩ Used in section 413.
⟨ Fetch the *space_factor* or the *prev_depth* 418 ⟩ Used in section 413.
⟨ Find an active node with fewest demerits 874 ⟩ Used in section 873.
⟨ Find hyphen locations for the word in *hc*, or **return** 923* ⟩ Used in section 895.
⟨ Find optimal breakpoints 863 ⟩ Used in section 815.
⟨ Find the best active node for the desired looseness 875 ⟩ Used in section 873.
⟨ Find the best way to split the insertion, and change *type*(*r*) to *split_up* 1010 ⟩ Used in section 1008.
⟨ Find the glue specification, *main_p*, for text spaces in the current font 1042 ⟩ Used in sections 1041 and 1043.
⟨ Finish an alignment in a display 1206 ⟩ Used in section 812.
⟨ Finish displayed math 1199 ⟩ Used in section 1194.
⟨ Finish issuing a diagnostic message for an overfull or underfull hbox 663 ⟩ Used in section 649.
⟨ Finish issuing a diagnostic message for an overfull or underfull vbox 675 ⟩ Used in section 668.
⟨ Finish line, emit a `\par` 351 ⟩ Used in section 347.
⟨ Finish line, emit a space 348 ⟩ Used in section 347.
⟨ Finish line, **goto** *switch* 350 ⟩ Used in section 347.
⟨ Finish math in text 1196 ⟩ Used in section 1194.
⟨ Finish the `DVI` file 642* ⟩ Used in section 1333*.
⟨ Finish the extensions 1378 ⟩ Used in section 1333*.
⟨ Fire up the user's output routine and **return** 1025 ⟩ Used in section 1012.
⟨ Fix the reference count, if any, and negate *cur_val* if *negative* 430 ⟩ Used in section 413.
⟨ Flush the box from memory, showing statistics if requested 639 ⟩ Used in section 638.
⟨ Forbidden cases detected in *main_control* 1048, 1098, 1111, 1144 ⟩ Used in section 1045.
⟨ Generate a *down* or *right* command for *w* and **return** 610 ⟩ Used in section 607.
⟨ Generate a *y0* or *z0* command in order to reuse a previous appearance of *w* 609 ⟩ Used in section 607.
⟨ Get ready to compress the trie 952 ⟩ Used in section 966*.
⟨ Get ready to start line breaking 816, 827, 834, 848 ⟩ Used in section 815.
⟨ Get substitution information, check it, goto *found* if all is ok, otherwise goto *continue* 1400* ⟩ Used in section 1398*.
⟨ Get the first line of input and prepare to start 1337* ⟩ Used in section 1332*.
⟨ Get the next non-blank non-call token 406 ⟩ Used in sections 405, 441, 455, 503, 526*, 577, 785, 791, and 1045.
⟨ Get the next non-blank non-relax non-call token 404 ⟩ Used in sections 403, 526*, 1078, 1084, 1151, 1160, 1211*, 1226, and 1270.
⟨ Get the next non-blank non-sign token; set *negative* appropriately 441 ⟩ Used in sections 440, 448, and 461.
⟨ Get the next token, suppressing expansion 358 ⟩ Used in section 357*.
⟨ Get user's advice and **return** 83 ⟩ Used in section 82*.
⟨ Give diagnostic information, if requested 1031 ⟩ Used in section 1030.
⟨ Give improper `\hyphenation` error 936 ⟩ Used in section 935.
⟨ Global variables 13, 20*, 26*, 30*, 32*, 39*, 50, 54*, 73*, 76, 79, 96, 104*, 115, 116*, 117, 118, 124, 165*, 173, 181, 213*, 246, 253*, 256*, 271*, 286, 297, 301*, 304*, 305, 308*, 309, 310, 333, 361, 382, 387, 388, 410, 438, 447, 480, 489, 493, 512, 513*, 520*, 527, 532*, 539, 549*, 550*, 555, 592*, 595*, 605, 616, 646, 647, 661, 684, 719, 724, 764, 770, 814, 821, 823, 825, 828, 833, 839, 847, 872, 892, 900, 905, 907, 921*, 926*, 943*, 947*, 950*, 971, 980, 982, 989, 1032, 1074, 1266, 1281, 1299, 1305*, 1331, 1342, 1345, 1379*, 1381*, 1383*, 1390*, 1393*, 1394*, 1399*, 1406*, 1407* ⟩ Used in section 4*.

⟨ Go into display math mode 1145 ⟩ Used in section 1138.
⟨ Go into ordinary math mode 1139* ⟩ Used in sections 1138 and 1142.
⟨ Go through the preamble list, determining the column widths and changing the alignrecords to dummy unset boxes 801 ⟩ Used in section 800.
⟨ Grow more variable-size memory and **goto** *restart* 126 ⟩ Used in section 125.
⟨ Handle situations involving spaces, braces, changes of state 347 ⟩ Used in section 344.
⟨ If a line number class has ended, create new active nodes for the best feasible breaks in that class; then **return** if $r = last\_active$, otherwise compute the new *line_width* 835 ⟩ Used in section 829.
⟨ If all characters of the family fit relative to h, then **goto** *found*, otherwise **goto** *not_found* 955 ⟩ Used in section 953.
⟨ If an alignment entry has just ended, take appropriate action 342 ⟩ Used in section 341*.
⟨ If an expanded code is present, reduce it and **goto** *start_cs* 355* ⟩ Used in sections 354* and 356*.
⟨ If dumping is not allowed, abort 1304 ⟩ Used in section 1302*.
⟨ If instruction *cur_i* is a kern with *cur_c*, attach the kern after q; or if it is a ligature with *cur_c*, combine noads q and p appropriately; then **return** if the cursor has moved past a noad, or **goto** *restart* 753 ⟩ Used in section 752.
⟨ If no hyphens were found, **return** 902 ⟩ Used in section 895.
⟨ If node *cur_p* is a legal breakpoint, call *try_break*; then update the active widths by including the glue in *glue_ptr*(*cur_p*) 868 ⟩ Used in section 866.
⟨ If node p is a legal breakpoint, check if this break is the best known, and **goto** *done* if p is null or if the page-so-far is already too full to accept more stuff 972 ⟩ Used in section 970.
⟨ If node q is a style node, change the style and **goto** *delete_q*; otherwise if it is not a noad, put it into the hlist, advance q, and **goto** *done*; otherwise set s to the size of noad q, set t to the associated type (*ord_noad* .. *inner_noad*), and set *pen* to the associated penalty 761 ⟩ Used in section 760.
⟨ If node r is of type *delta_node*, update *cur_active_width*, set *prev_r* and *prev_prev_r*, then **goto** *continue* 832 ⟩ Used in section 829.
⟨ If the current list ends with a box node, delete it from the list and make *cur_box* point to it; otherwise set *cur_box* ← *null* 1080 ⟩ Used in section 1079.
⟨ If the current page is empty and node p is to be deleted, **goto** *done1*; otherwise use node p to update the state of the current page; if this node is an insertion, **goto** *contribute*; otherwise if this node is not a legal breakpoint, **goto** *contribute* or *update_heights*; otherwise set *pi* to the penalty associated with this breakpoint 1000 ⟩ Used in section 997.
⟨ If the cursor is immediately followed by the right boundary, **goto** *reswitch*; if it's followed by an invalid character, **goto** *big_switch*; otherwise move the cursor one step to the right and **goto** *main_lig_loop* 1036* ⟩ Used in section 1034*.
⟨ If the next character is a parameter number, make *cur_tok* a *match* token; but if it is a left brace, store '*left_brace*, *end_match*', set *hash_brace*, and **goto** *done* 476 ⟩ Used in section 474.
⟨ If the preamble list has been traversed, check that the row has ended 792 ⟩ Used in section 791.
⟨ If the right-hand side is a token parameter or token register, finish the assignment and **goto** *done* 1227 ⟩ Used in section 1226.
⟨ If the string *hyph_word*[h] is less than $hc[1 .. hn]$, **goto** *not_found*; but if the two strings are equal, set *hyf* to the hyphen positions and **goto** *found* 931* ⟩ Used in section 930*.
⟨ If the string *hyph_word*[h] is less than or equal to s, interchange (*hyph_word*[h], *hyph_list*[h]) with (s, p) 941* ⟩ Used in section 940*.
⟨ If there's a ligature or kern at the cursor position, update the data structures, possibly advancing j; continue until the cursor moves 909 ⟩ Used in section 906.
⟨ If there's a ligature/kern command relevant to *cur_l* and *cur_r*, adjust the text appropriately; exit to *main_loop_wrapup* 1039 ⟩ Used in section 1034*.
⟨ If this font has already been loaded, set f to the internal font number and **goto** *common_ending* 1260* ⟩ Used in section 1257*.
⟨ If this *sup_mark* starts an expanded character like `^^A` or `^^df`, then **goto** *reswitch*, otherwise set *state* ← *mid_line* 352 ⟩ Used in section 344.

⟨ Ignore the fraction operation and complain about this ambiguous case 1183 ⟩ Used in section 1181.
⟨ Implement \closeout 1353 ⟩ Used in section 1348*.
⟨ Implement \immediate 1375 ⟩ Used in section 1348*.
⟨ Implement \openout 1351 ⟩ Used in section 1348*.
⟨ Implement \setlanguage 1377 ⟩ Used in section 1348*.
⟨ Implement \special 1354* ⟩ Used in section 1348*.
⟨ Implement \write 1352 ⟩ Used in section 1348*.
⟨ Incorporate a whatsit node into a vbox 1359 ⟩ Used in section 669.
⟨ Incorporate a whatsit node into an hbox 1360 ⟩ Used in section 651.
⟨ Incorporate box dimensions into the dimensions of the hbox that will contain it 653 ⟩ Used in section 651.
⟨ Incorporate box dimensions into the dimensions of the vbox that will contain it 670 ⟩ Used in section 669.
⟨ Incorporate character dimensions into the dimensions of the hbox that will contain it, then move to the next node 654 ⟩ Used in section 651.
⟨ Incorporate glue into the horizontal totals 656 ⟩ Used in section 651.
⟨ Incorporate glue into the vertical totals 671 ⟩ Used in section 669.
⟨ Increase the number of parameters in the last font 580 ⟩ Used in section 578.
⟨ Initialize for hyphenating a paragraph 891 ⟩ Used in section 863.
⟨ Initialize table entries (done by INITEX only) 164, 222*, 228, 232, 240*, 250, 258*, 552*, 946*, 951*, 1216, 1301*, 1369 ⟩ Used in section 8*.
⟨ Initialize the current page, insert the \topskip glue ahead of p, and **goto** *continue* 1001 ⟩ Used in section 1000.
⟨ Initialize the input routines 331* ⟩ Used in section 1337*.
⟨ Initialize the output routines 55, 61*, 528, 533 ⟩ Used in section 1332*.
⟨ Initialize the print *selector* based on *interaction* 75 ⟩ Used in sections 1265* and 1337*.
⟨ Initialize the special list heads and constant nodes 790, 797, 820, 981, 988 ⟩ Used in section 164.
⟨ Initialize variables as *ship_out* begins 617* ⟩ Used in section 640*.
⟨ Initialize whatever TEX might access 8* ⟩ Used in section 4*.
⟨ Initiate or terminate input from a file 378 ⟩ Used in section 367.
⟨ Initiate the construction of an hbox or vbox, then **return** 1083 ⟩ Used in section 1079.
⟨ Input and store tokens from the next line of the file 483 ⟩ Used in section 482.
⟨ Input for \read from the terminal 484* ⟩ Used in section 483.
⟨ Input from external file, **goto** *restart* if no input found 343* ⟩ Used in section 341*.
⟨ Input from token list, **goto** *restart* if end of list or if a parameter needs to be expanded 357* ⟩ Used in section 341*.
⟨ Input the first line of *read_file*[m] 485 ⟩ Used in section 483.
⟨ Input the next line of *read_file*[m] 486 ⟩ Used in section 483.
⟨ Insert a delta node to prepare for breaks at *cur_p* 843 ⟩ Used in section 836.
⟨ Insert a delta node to prepare for the next active node 844 ⟩ Used in section 836.
⟨ Insert a dummy noad to be sub/superscripted 1177 ⟩ Used in section 1176.
⟨ Insert a new active node from *best_place*[*fit_class*] to *cur_p* 845 ⟩ Used in section 836.
⟨ Insert a new control sequence after p, then make p point to it 260* ⟩ Used in section 259.
⟨ Insert a new pattern into the linked trie 963* ⟩ Used in section 961.
⟨ Insert a new trie node between q and p, and make p point to it 964* ⟩ Used in section 963*.
⟨ Insert a token containing *frozen_endv* 375 ⟩ Used in section 366*.
⟨ Insert a token saved by \afterassignment, if any 1269 ⟩ Used in section 1211*.
⟨ Insert glue for *split_top_skip* and set $p \leftarrow$ *null* 969 ⟩ Used in section 968.
⟨ Insert hyphens as specified in *hyph_list*[h] 932 ⟩ Used in section 931*.
⟨ Insert macro parameter and **goto** *restart* 359 ⟩ Used in section 357*.
⟨ Insert the appropriate mark text into the scanner 386 ⟩ Used in section 367.
⟨ Insert the current list into its environment 812 ⟩ Used in section 800.
⟨ Insert the pair (s, p) into the exception table 940* ⟩ Used in section 939*.
⟨ Insert the ⟨v_j⟩ template and **goto** *restart* 789 ⟩ Used in section 342.

⟨ Insert token p into TEX's input 326 ⟩ Used in section 282.
⟨ Interpret code c and **return** if done 84* ⟩ Used in section 83.
⟨ Introduce new material from the terminal and **return** 87 ⟩ Used in section 84*.
⟨ Issue an error message if $cur\_val = fmem\_ptr$ 579 ⟩ Used in section 578.
⟨ Justify the line ending at breakpoint cur_p, and append it to the current vertical list, together with associated penalties and other insertions 880 ⟩ Used in section 877.
⟨ Last-minute procedures 1333*, 1335*, 1336, 1338* ⟩ Used in section 1330.
⟨ Lengthen the preamble periodically 793 ⟩ Used in section 792.
⟨ Let cur_h be the position of the first box, and set $leader\_wd + lx$ to the spacing between corresponding parts of boxes 627 ⟩ Used in section 626.
⟨ Let cur_v be the position of the first box, and set $leader\_ht + lx$ to the spacing between corresponding parts of boxes 636 ⟩ Used in section 635.
⟨ Let d be the natural width of node p; if the node is "visible," **goto** *found*; if the node is glue that stretches or shrinks, set $v \leftarrow max\_dimen$ 1147 ⟩ Used in section 1146.
⟨ Let d be the natural width of this glue; if stretching or shrinking, set $v \leftarrow max\_dimen$; **goto** *found* in the case of leaders 1148 ⟩ Used in section 1147.
⟨ Let d be the width of the whatsit p 1361 ⟩ Used in section 1147.
⟨ Let n be the largest legal code value, based on cur_chr 1233 ⟩ Used in section 1232*.
⟨ Link node p into the current page and **goto** *done* 998 ⟩ Used in section 997.
⟨ Local variables for dimension calculations 450 ⟩ Used in section 448.
⟨ Local variables for finishing a displayed formula 1198 ⟩ Used in section 1194.
⟨ Local variables for formatting calculations 315 ⟩ Used in section 311.
⟨ Local variables for hyphenation 901, 912, 922, 929 ⟩ Used in section 895.
⟨ Local variables for initialization 19*, 163, 927 ⟩ Used in section 4*.
⟨ Local variables for line breaking 862, 893 ⟩ Used in section 815.
⟨ Look ahead for another character, or leave lig_stack empty if there's none there 1038 ⟩ Used in section 1034*.
⟨ Look at all the marks in nodes before the break, and set the final link to *null* at the break 979 ⟩ Used in section 977.
⟨ Look at the list of characters starting with x in font g; set f and c whenever a better character is found; **goto** *found* as soon as a large enough variant is encountered 708* ⟩ Used in section 707.
⟨ Look at the other stack entries until deciding what sort of DVI command to generate; **goto** *found* if node p is a "hit" 611 ⟩ Used in section 607.
⟨ Look at the variants of (z, x); set f and c whenever a better character is found; **goto** *found* as soon as a large enough variant is encountered 707 ⟩ Used in section 706.
⟨ Look for parameter number or ## 479 ⟩ Used in section 477.
⟨ Look for the word $hc[1 \mathinner{..} hn]$ in the exception table, and **goto** *found* (with *hyf* containing the hyphens) if an entry is found 930* ⟩ Used in section 923*.
⟨ Look up the characters of list r in the hash table, and set cur_cs 374 ⟩ Used in section 372*.
⟨ Make a copy of node p in node r 205 ⟩ Used in section 204.
⟨ Make a ligature node, if $ligature\_present$; insert a null discretionary, if appropriate 1035 ⟩ Used in section 1034*.
⟨ Make a partial copy of the whatsit node p and make r point to it; set $words$ to the number of initial words not yet copied 1357 ⟩ Used in section 206.
⟨ Make a second pass over the mlist, removing all noads and inserting the proper spacing and penalties 760 ⟩ Used in section 726.
⟨ Make final adjustments and **goto** *done* 576* ⟩ Used in section 562.
⟨ Make node p look like a $char\_node$ and **goto** *reswitch* 652 ⟩ Used in sections 622, 651, and 1147.
⟨ Make sure that $page\_max\_depth$ is not exceeded 1003 ⟩ Used in section 997.
⟨ Make sure that pi is in the proper range 831 ⟩ Used in section 829.
⟨ Make the contribution list empty by setting its tail to $contrib\_head$ 995 ⟩ Used in section 994.
⟨ Make the first 256 strings 48 ⟩ Used in section 47*.
⟨ Make the height of box y equal to h 739 ⟩ Used in section 738.

⟨ Make the running dimensions in rule q extend to the boundaries of the alignment 806 ⟩ Used in section 805.
⟨ Make the unset node r into a *vlist_node* of height w, setting the glue as if the height were t 811 ⟩ Used in section 808.
⟨ Make the unset node r into an *hlist_node* of width w, setting the glue as if the width were t 810 ⟩ Used in section 808.
⟨ Make variable b point to a box for (f, c) 710 ⟩ Used in section 706.
⟨ Manufacture a control sequence name 372* ⟩ Used in section 367.
⟨ Math-only cases in non-math modes, or vice versa 1046 ⟩ Used in section 1045.
⟨ Merge the widths in the span nodes of q with those of p, destroying the span nodes of q 803 ⟩ Used in section 801.
⟨ Modify the end of the line to reflect the nature of the break and to include `\rightskip`; also set the proper value of *disc_break* 881 ⟩ Used in section 880.
⟨ Modify the glue specification in *main_p* according to the space factor 1044 ⟩ Used in section 1043.
⟨ Move down or output leaders 634 ⟩ Used in section 631.
⟨ Move node p to the current page; if it is time for a page break, put the nodes following the break back onto the contribution list, and **return** to the user's output routine if there is one 997 ⟩ Used in section 994.
⟨ Move pointer s to the end of the current list, and set *replace_count*(r) appropriately 918 ⟩ Used in section 914.
⟨ Move right or output leaders 625 ⟩ Used in section 622.
⟨ Move the characters of a ligature node to *hu* and *hc*; but **goto** *done3* if they are not all letters 898 ⟩ Used in section 897.
⟨ Move the cursor past a pseudo-ligature, then **goto** *main_loop_lookahead* or *main_lig_loop* 1037 ⟩ Used in section 1034*.
⟨ Move the data into *trie* 958* ⟩ Used in section 966*.
⟨ Move to next line of file, or **goto** *restart* if there is no next line, or **return** if a `\read` line has finished 360 ⟩ Used in section 343*.
⟨ Negate all three glue components of *cur_val* 431 ⟩ Used in section 430.
⟨ Nullify *width*(q) and the tabskip glue following this column 802 ⟩ Used in section 801.
⟨ Numbered cases for *debug_help* 1339* ⟩ Used in section 1338*.
⟨ Open *tfm_file* for input 563* ⟩ Used in section 562.
⟨ Other local variables for *try_break* 830 ⟩ Used in section 829.
⟨ Output a box in a vlist 632 ⟩ Used in section 631.
⟨ Output a box in an hlist 623 ⟩ Used in section 622.
⟨ Output a leader box at *cur_h*, then advance *cur_h* by *leader_wd* + *lx* 628 ⟩ Used in section 626.
⟨ Output a leader box at *cur_v*, then advance *cur_v* by *leader_ht* + *lx* 637 ⟩ Used in section 635.
⟨ Output a rule in a vlist, **goto** *next_p* 633 ⟩ Used in section 631.
⟨ Output a rule in an hlist 624 ⟩ Used in section 622.
⟨ Output a substitution, **goto** *continue* if not possible 1398* ⟩ Used in section 620*.
⟨ Output leaders in a vlist, **goto** *fin_rule* if a rule or to *next_p* if done 635 ⟩ Used in section 634.
⟨ Output leaders in an hlist, **goto** *fin_rule* if a rule or to *next_p* if done 626 ⟩ Used in section 625.
⟨ Output node p for *hlist_out* and move to the next node, maintaining the condition *cur_v* = *base_line* 620* ⟩ Used in section 619*.
⟨ Output node p for *vlist_out* and move to the next node, maintaining the condition *cur_h* = *left_edge* 630 ⟩ Used in section 629.
⟨ Output statistics about this job 1334* ⟩ Used in section 1333*.
⟨ Output the font definitions for all fonts that were used 643 ⟩ Used in section 642*.
⟨ Output the font name whose internal number is f 603 ⟩ Used in section 602*.
⟨ Output the non-*char_node* p for *hlist_out* and move to the next node 622 ⟩ Used in section 620*.
⟨ Output the non-*char_node* p for *vlist_out* 631 ⟩ Used in section 630.
⟨ Output the whatsit node p in a vlist 1366 ⟩ Used in section 631.
⟨ Output the whatsit node p in an hlist 1367 ⟩ Used in section 622.
⟨ Pack the family into *trie* relative to h 956 ⟩ Used in section 953.
⟨ Package an unset box for the current column and record its width 796 ⟩ Used in section 791.

⟨ Package the preamble list, to determine the actual tabskip glue amounts, and let p point to this prototype box 804 ⟩ Used in section 800.
⟨ Perform the default output routine 1023 ⟩ Used in section 1012.
⟨ Pontificate about improper alignment in display 1207 ⟩ Used in section 1206.
⟨ Pop the condition stack 496 ⟩ Used in sections 498, 500, 509, and 510.
⟨ Prepare all the boxes involved in insertions to act as queues 1018 ⟩ Used in section 1014.
⟨ Prepare to deactivate node r, and **goto** *deactivate* unless there is a reason to consider lines of text from r to *cur_p* 854 ⟩ Used in section 851.
⟨ Prepare to insert a token that matches *cur_group*, and print what it is 1065 ⟩ Used in section 1064.
⟨ Prepare to move a box or rule node to the current page, then **goto** *contribute* 1002 ⟩ Used in section 1000.
⟨ Prepare to move whatsit p to the current page, then **goto** *contribute* 1364 ⟩ Used in section 1000.
⟨ Print a short indication of the contents of node p 175 ⟩ Used in section 174*.
⟨ Print a symbolic description of the new break node 846 ⟩ Used in section 845.
⟨ Print a symbolic description of this feasible break 856 ⟩ Used in section 855.
⟨ Print character substitution tracing log 1401* ⟩ Used in section 1398*.
⟨ Print either '`definition`' or '`use`' or '`preamble`' or '`text`', and insert tokens that should lead to recovery 339* ⟩ Used in section 338*.
⟨ Print location of current line 313 ⟩ Used in section 312.
⟨ Print newly busy locations 171 ⟩ Used in section 167.
⟨ Print string s as an error message 1283* ⟩ Used in section 1279*.
⟨ Print string s on the terminal 1280* ⟩ Used in section 1279*.
⟨ Print the banner line, including the date and time 536* ⟩ Used in section 534*.
⟨ Print the font identifier for *font*(p) 267 ⟩ Used in sections 174* and 176*.
⟨ Print the help information and **goto** *continue* 89 ⟩ Used in section 84*.
⟨ Print the list between *printed_node* and *cur_p*, then set *printed_node* ← *cur_p* 857 ⟩ Used in section 856.
⟨ Print the menu of available options 85 ⟩ Used in section 84*.
⟨ Print the result of command c 472 ⟩ Used in section 470.
⟨ Print two lines using the tricky pseudoprinted information 317 ⟩ Used in section 312.
⟨ Print type of token list 314 ⟩ Used in section 312.
⟨ Process an active-character control sequence and set *state* ← *mid_line* 353 ⟩ Used in section 344.
⟨ Process node-or-noad q as much as possible in preparation for the second pass of *mlist_to_hlist*, then move to the next item in the mlist 727 ⟩ Used in section 726.
⟨ Process whatsit p in *vert_break* loop, **goto** *not_found* 1365 ⟩ Used in section 973.
⟨ Prune the current list, if necessary, until it contains only *char_node*, *kern_node*, *hlist_node*, *vlist_node*, *rule_node*, and *ligature_node* items; set n to the length of the list, and set q to the list's tail 1121 ⟩ Used in section 1119.
⟨ Prune unwanted nodes at the beginning of the next line 879 ⟩ Used in section 877.
⟨ Pseudoprint the line 318* ⟩ Used in section 312.
⟨ Pseudoprint the token list 319 ⟩ Used in section 312.
⟨ Push the condition stack 495 ⟩ Used in section 498.
⟨ Put each of TEX's primitives into the hash table 226, 230*, 238*, 248, 265*, 334, 376, 384, 411, 416, 468, 487, 491, 553, 780, 983, 1052, 1058, 1071, 1088, 1107, 1114, 1141, 1156, 1169, 1178, 1188, 1208, 1219*, 1222*, 1230*, 1250, 1254, 1262, 1272, 1277, 1286, 1291, 1344* ⟩ Used in section 1336.
⟨ Put help message on the transcript file 90 ⟩ Used in section 82*.
⟨ Put the characters $hu[i+1\,..]$ into *post_break*(r), appending to this list and to *major_tail* until synchronization has been achieved 916 ⟩ Used in section 914.
⟨ Put the characters $hu[l\,..\,i]$ and a hyphen into *pre_break*(r) 915 ⟩ Used in section 914.
⟨ Put the fraction into a box with its delimiters, and make *new_hlist*(q) point to it 748 ⟩ Used in section 743.
⟨ Put the `\leftskip` glue at the left and detach this line 887 ⟩ Used in section 880.
⟨ Put the optimal current page into box 255, update *first_mark* and *bot_mark*, append insertions to their boxes, and put the remaining nodes back on the contribution list 1014 ⟩ Used in section 1012.
⟨ Put the (positive) 'at' size into s 1259 ⟩ Used in section 1258.

⟨ Put the \rightskip glue after node q 886 ⟩ Used in section 881.
⟨ Read and check the font data; *abort* if the TFM file is malformed; if there's no room for this font, say so and **goto** *done*; otherwise *incr*(*font_ptr*) and **goto** *done* 562 ⟩ Used in section 560*.
⟨ Read box dimensions 571 ⟩ Used in section 562.
⟨ Read character data 569 ⟩ Used in section 562.
⟨ Read extensible character recipes 574 ⟩ Used in section 562.
⟨ Read font parameters 575* ⟩ Used in section 562.
⟨ Read ligature/kern program 573* ⟩ Used in section 562.
⟨ Read next line of file into *buffer*, or **goto** *restart* if the file has ended 362 ⟩ Used in section 360.
⟨ Read the first line of the new file 538 ⟩ Used in section 537*.
⟨ Read the other strings from the TEX.POOL file and return *true*, or give an error message and return *false* 51* ⟩ Used in section 47*.
⟨ Read the TFM header 568 ⟩ Used in section 562.
⟨ Read the TFM size fields 565 ⟩ Used in section 562.
⟨ Readjust the height and depth of *cur_box*, for \vtop 1087 ⟩ Used in section 1086.
⟨ Rebuild character using substitution information 1402* ⟩ Used in section 1398*.
⟨ Reconstitute nodes for the hyphenated word, inserting discretionary hyphens 913 ⟩ Used in section 903.
⟨ Record a new feasible break 855 ⟩ Used in section 851.
⟨ Recover from an unbalanced output routine 1027 ⟩ Used in section 1026.
⟨ Recover from an unbalanced write command 1372 ⟩ Used in section 1371.
⟨ Recycle node p 999 ⟩ Used in section 997.
⟨ Remove the last box, unless it's part of a discretionary 1081 ⟩ Used in section 1080.
⟨ Replace nodes ha .. hb by a sequence of nodes that includes the discretionary hyphens 903 ⟩ Used in section 895.
⟨ Replace the tail of the list by p 1187 ⟩ Used in section 1186.
⟨ Replace z by z' and compute α, β 572 ⟩ Used in section 571.
⟨ Report a runaway argument and abort 396 ⟩ Used in sections 392 and 399.
⟨ Report a tight hbox and **goto** *common_ending*, if this box is sufficiently bad 667 ⟩ Used in section 664.
⟨ Report a tight vbox and **goto** *common_ending*, if this box is sufficiently bad 678 ⟩ Used in section 676.
⟨ Report an extra right brace and **goto** *continue* 395 ⟩ Used in section 392.
⟨ Report an improper use of the macro and abort 398 ⟩ Used in section 397.
⟨ Report an overfull hbox and **goto** *common_ending*, if this box is sufficiently bad 666 ⟩ Used in section 664.
⟨ Report an overfull vbox and **goto** *common_ending*, if this box is sufficiently bad 677 ⟩ Used in section 676.
⟨ Report an underfull hbox and **goto** *common_ending*, if this box is sufficiently bad 660 ⟩ Used in section 658.
⟨ Report an underfull vbox and **goto** *common_ending*, if this box is sufficiently bad 674 ⟩ Used in section 673.
⟨ Report overflow of the input buffer, and abort 35* ⟩ Used in section 31*.
⟨ Report that an invalid delimiter code is being changed to null; set $cur\_val \leftarrow 0$ 1161 ⟩ Used in section 1160.
⟨ Report that the font won't be loaded 561* ⟩ Used in section 560*.
⟨ Report that this dimension is out of range 460 ⟩ Used in section 448.
⟨ Resume the page builder after an output routine has come to an end 1026 ⟩ Used in section 1100.
⟨ Reverse the links of the relevant passive nodes, setting *cur_p* to the first breakpoint 878 ⟩ Used in section 877.
⟨ Scan a control sequence and set $state \leftarrow skip\_blanks$ or *mid_line* 354* ⟩ Used in section 344.
⟨ Scan a numeric constant 444 ⟩ Used in section 440.
⟨ Scan a parameter until its delimiter string has been found; or, if $s = null$, simply scan the delimiter string 392 ⟩ Used in section 391.
⟨ Scan a subformula enclosed in braces and **return** 1153 ⟩ Used in section 1151.
⟨ Scan ahead in the buffer until finding a nonletter; if an expanded code is encountered, reduce it and **goto** *start_cs*; otherwise if a multiletter control sequence is found, adjust *cur_cs* and *loc*, and **goto** *found* 356* ⟩ Used in section 354*.
⟨ Scan an alphabetic character code into *cur_val* 442 ⟩ Used in section 440.
⟨ Scan an optional space 443 ⟩ Used in sections 442, 448, 455, and 1200.
⟨ Scan and build the body of the token list; **goto** *found* when finished 477 ⟩ Used in section 473.

⟨ Scan and build the parameter part of the macro definition 474 ⟩ Used in section 473.
⟨ Scan decimal fraction 452 ⟩ Used in section 448.
⟨ Scan file name in the buffer 531 ⟩ Used in section 530*.
⟨ Scan for all other units and adjust *cur_val* and *f* accordingly; **goto** *done* in the case of scaled points 458 ⟩ Used in section 453.
⟨ Scan for `fil` units; **goto** *attach_fraction* if found 454 ⟩ Used in section 453.
⟨ Scan for `mu` units and **goto** *attach_fraction* 456 ⟩ Used in section 453.
⟨ Scan for units that are internal dimensions; **goto** *attach_sign* with *cur_val* set if found 455 ⟩ Used in section 453.
⟨ Scan preamble text until *cur_cmd* is *tab_mark* or *car_ret*, looking for changes in the tabskip glue; append an alignrecord to the preamble list 779 ⟩ Used in section 777.
⟨ Scan the argument for command *c* 471 ⟩ Used in section 470.
⟨ Scan the font size specification 1258 ⟩ Used in section 1257*.
⟨ Scan the parameters and make *link*(*r*) point to the macro body; but **return** if an illegal `\par` is detected 391 ⟩ Used in section 389.
⟨ Scan the preamble and record it in the *preamble* list 777 ⟩ Used in section 774.
⟨ Scan the template ⟨u_j⟩, putting the resulting token list in *hold_head* 783 ⟩ Used in section 779.
⟨ Scan the template ⟨v_j⟩, putting the resulting token list in *hold_head* 784 ⟩ Used in section 779.
⟨ Scan units and set *cur_val* to $x \cdot (cur\_val + f/2^{16})$, where there are x sp per unit; **goto** *attach_sign* if the units are internal 453 ⟩ Used in section 448.
⟨ Search *eqtb* for equivalents equal to *p* 255 ⟩ Used in section 172.
⟨ Search *hyph_list* for pointers to *p* 933 ⟩ Used in section 172.
⟨ Search *save_stack* for equivalents that point to *p* 285 ⟩ Used in section 172.
⟨ Select the appropriate case and **return** or **goto** *common_ending* 509 ⟩ Used in section 501*.
⟨ Set initial values of key variables 21, 23*, 24*, 74*, 77, 80, 97, 166, 215*, 254, 257*, 272, 287, 383, 439, 481, 490, 551*, 556, 593, 596, 606, 648, 662, 685, 771, 928*, 990, 1033, 1267, 1282, 1300, 1343, 1380*, 1391*, 1395*, 1408* ⟩ Used in section 8*.
⟨ Set line length parameters in preparation for hanging indentation 849 ⟩ Used in section 848.
⟨ Set the glue in all the unset boxes of the current list 805 ⟩ Used in section 800.
⟨ Set the glue in node *r* and change it from an unset node 808 ⟩ Used in section 807.
⟨ Set the unset box *q* and the unset boxes in it 807 ⟩ Used in section 805.
⟨ Set the value of *b* to the badness for shrinking the line, and compute the corresponding *fit_class* 853 ⟩ Used in section 851.
⟨ Set the value of *b* to the badness for stretching the line, and compute the corresponding *fit_class* 852 ⟩ Used in section 851.
⟨ Set the value of *output_penalty* 1013 ⟩ Used in section 1012.
⟨ Set up data structures with the cursor following position *j* 908 ⟩ Used in section 906.
⟨ Set up the values of *cur_size* and *cur_mu*, based on *cur_style* 703 ⟩ Used in sections 720, 726, 730, 754, 760, and 763.
⟨ Set variable *c* to the current escape character 243 ⟩ Used in section 63.
⟨ Ship box *p* out 640* ⟩ Used in section 638.
⟨ Show equivalent *n*, in region 1 or 2 223 ⟩ Used in section 252*.
⟨ Show equivalent *n*, in region 3 229 ⟩ Used in section 252*.
⟨ Show equivalent *n*, in region 4 233 ⟩ Used in section 252*.
⟨ Show equivalent *n*, in region 5 242 ⟩ Used in section 252*.
⟨ Show equivalent *n*, in region 6 251 ⟩ Used in section 252*.
⟨ Show the auxiliary field, *a* 219* ⟩ Used in section 218.
⟨ Show the current contents of a box 1296 ⟩ Used in section 1293.
⟨ Show the current meaning of a token, then **goto** *common_ending* 1294 ⟩ Used in section 1293.
⟨ Show the current value of some parameter or register, then **goto** *common_ending* 1297 ⟩ Used in section 1293.
⟨ Show the font identifier in *eqtb*[*n*] 234 ⟩ Used in section 233.
⟨ Show the halfword code in *eqtb*[*n*] 235 ⟩ Used in section 233.

⟨ Show the status of the current page 986 ⟩ Used in section 218.
⟨ Show the text of the macro being expanded 401 ⟩ Used in section 389.
⟨ Simplify a trivial box 721 ⟩ Used in section 720.
⟨ Skip to `\else` or `\fi`, then **goto** *common_ending* 500 ⟩ Used in section 498.
⟨ Skip to node *ha*, or **goto** *done1* if no hyphenation should be attempted 896 ⟩ Used in section 894.
⟨ Skip to node *hb*, putting letters into *hu* and *hc* 897 ⟩ Used in section 894.
⟨ Sort *p* into the list starting at *rover* and advance *p* to *rlink*(*p*) 132 ⟩ Used in section 131.
⟨ Sort the hyphenation op tables into proper order 945* ⟩ Used in section 952.
⟨ Split off part of a vertical box, make *cur_box* point to it 1082 ⟩ Used in section 1079.
⟨ Squeeze the equation as much as possible; if there is an equation number that should go on a separate line by itself, set $e \leftarrow 0$ 1201 ⟩ Used in section 1199.
⟨ Start a new current page 991 ⟩ Used in section 1017.
⟨ Store *cur_box* in a box register 1077 ⟩ Used in section 1075.
⟨ Store maximum values in the *hyf* table 924* ⟩ Used in section 923*.
⟨ Store *save_stack*[*save_ptr*] in *eqtb*[*p*], unless *eqtb*[*p*] holds a global value 283* ⟩ Used in section 282.
⟨ Store the current token, but **goto** *continue* if it is a blank space that would become an undelimited parameter 393 ⟩ Used in section 392.
⟨ Subtract glue from *break_width* 838 ⟩ Used in section 837.
⟨ Subtract the width of node *v* from *break_width* 841 ⟩ Used in section 840.
⟨ Suppress expansion of the next token 369 ⟩ Used in section 367.
⟨ Swap the subscript and superscript into box *x* 742 ⟩ Used in section 738.
⟨ Switch to a larger accent if available and appropriate 740* ⟩ Used in section 738.
⟨ Tell the user what has run away and try to recover 338* ⟩ Used in section 336.
⟨ Terminate the current conditional and skip to `\fi` 510 ⟩ Used in section 367.
⟨ Test box register status 505 ⟩ Used in section 501*.
⟨ Test if an integer is odd 504 ⟩ Used in section 501*.
⟨ Test if two characters match 506 ⟩ Used in section 501*.
⟨ Test if two macro texts match 508 ⟩ Used in section 507.
⟨ Test if two tokens match 507 ⟩ Used in section 501*.
⟨ Test relation between integers or dimensions 503 ⟩ Used in section 501*.
⟨ The em width for *cur_font* 558 ⟩ Used in section 455.
⟨ The x-height for *cur_font* 559 ⟩ Used in section 455.
⟨ Tidy up the parameter just scanned, and tuck it away 400 ⟩ Used in section 392.
⟨ Transfer node *p* to the adjustment list 655 ⟩ Used in section 651.
⟨ Transplant the post-break list 884 ⟩ Used in section 882.
⟨ Transplant the pre-break list 885 ⟩ Used in section 882.
⟨ Treat *cur_chr* as an active character 1152 ⟩ Used in sections 1151 and 1155.
⟨ Try the final line break at the end of the paragraph, and **goto** *done* if the desired breakpoints have been found 873 ⟩ Used in section 863.
⟨ Try to allocate within node *p* and its physical successors, and **goto** *found* if allocation was possible 127 ⟩ Used in section 125.
⟨ Try to break after a discretionary fragment, then **goto** *done5* 869 ⟩ Used in section 866.
⟨ Try to get a different log file name 535 ⟩ Used in section 534*.
⟨ Try to hyphenate the following word 894 ⟩ Used in section 866.
⟨ Try to recover from mismatched `\right` 1192 ⟩ Used in section 1191.
⟨ Types in the outer block 18, 25, 38*, 101, 109*, 113*, 150, 212, 269, 300, 548*, 594, 920*, 925* ⟩ Used in section 4*.
⟨ Undump MLTEX-specific data 1404* ⟩ Used in section 1303*.
⟨ Undump a couple more things and the closing check word 1327* ⟩ Used in section 1303*.
⟨ Undump constants for consistency check 1308* ⟩ Used in section 1303*.
⟨ Undump encTEX-specific data 1413* ⟩ Used in section 1303*.
⟨ Undump regions 1 to 6 of *eqtb* 1317* ⟩ Used in section 1314*.
⟨ Undump the array info for internal font number *k* 1323* ⟩ Used in section 1321*.

⟨ Undump the dynamic memory 1312* ⟩ Used in section 1303*.
⟨ Undump the font information 1321* ⟩ Used in section 1303*.
⟨ Undump the hash table 1319* ⟩ Used in section 1314*.
⟨ Undump the hyphenation tables 1325* ⟩ Used in section 1303*.
⟨ Undump the string pool 1310* ⟩ Used in section 1303*.
⟨ Undump the table of equivalents 1314* ⟩ Used in section 1303*.
⟨ Undump *xord*, *xchr*, and *xprn* 1387* ⟩ Used in section 1308*.
⟨ Update the active widths, since the first active node has been deleted 861 ⟩ Used in section 860.
⟨ Update the current height and depth measurements with respect to a glue or kern node *p* 976 ⟩ Used in section 972.
⟨ Update the current page measurements with respect to the glue or kern specified by node *p* 1004 ⟩ Used in section 997.
⟨ Update the value of *printed_node* for symbolic displays 858 ⟩ Used in section 829.
⟨ Update the values of *first_mark* and *bot_mark* 1016 ⟩ Used in section 1014.
⟨ Update the values of *last_glue*, *last_penalty*, and *last_kern* 996 ⟩ Used in section 994.
⟨ Update the values of *max_h* and *max_v*; but if the page is too large, **goto** *done* 641 ⟩ Used in section 640*.
⟨ Update width entry for spanned columns 798 ⟩ Used in section 796.
⟨ Use code *c* to distinguish between generalized fractions 1182 ⟩ Used in section 1181.
⟨ Use node *p* to update the current height and depth measurements; if this node is not a legal breakpoint, **goto** *not_found* or *update_heights*, otherwise set *pi* to the associated penalty at the break 973 ⟩ Used in section 972.
⟨ Use size fields to allocate font information 566 ⟩ Used in section 562.
⟨ Wipe out the whatsit node *p* and **goto** *done* 1358 ⟩ Used in section 202.
⟨ Wrap up the box specified by node *r*, splitting node *p* if called for; set *wait* ← *true* if node *p* holds a remainder after splitting 1021 ⟩ Used in section 1020.
